1 EXECUTIVE SUMMARY

This document summarizes the instrument and product quality status as derived from data acquired during August 2005.

No major anomalies have been experienced during this period. The list of unavailability periods is provided in Chapter 2.

Chapter 3 provides information on the actual low rate BRM mission planning.

Details on the Doppler Centroid evolution are provided in chapter 4.

Radiometric stability is measured by means of ASAR and Radarsat transponders. Detailed results are provided in chapter 5.

An updated list of auxiliary data files is provided in chapters 6 and 7.

2 INSTRUMENT STATUS

No major anomalies experienced during this period.
Tree single Antenna Transmit/Receive Module (TRM) failures have been experienced (the first ones after the launch):

- TRM-14 in tile B2: failed to transmit in H polarization since 12-APR-2004
- TRM-15 in tile A1: failed to transmit in V polarization since 17-APR-2004
- TRM-06 in tile A1: failed to transmit in V polarization since 17-NOV-2004
- TRM-12 in tile C4: failed to transmit in H polarization since 16-JAN-2005

Please note that a single TRM transmit failures have no significant impact on the instrument performance nor on the antenna pattern radiation shape.

2.1 Instrument unavailability

The new events with respect to the previous report are given in the table below. Please note that the full unavailability list is available on appendix A.

Unavailability report reference	Start	Stop

2.2 Data disclaimer

A data quality disclaimer is issued each time that ASAR data of degraded quality is acquired between specific time intervals. Details on the available disclaimers are provided online at **http://earth.esa.int/pcs/envisat/asar/disclaimer**. Please note that the full disclaimer list is available on appendix B.

During August 2005 two new disclaimers have been issued.

3 LOW RATE BACKGROUND REGIONAL MISSION

The current Low Rte BRM definition is provided below:

4 DOPPLER MONITORING

The Envisat Orbit Control Manoeuvres (OCM) can affect the platform attitude stability even few ours after the burst with a direct impact on the Doppler centroid frequency evolution. An updated list of the OCM can be found at **http://nng.esoc.esa.de/envisat/ENVmano.html**.

Latest AOCS corrections

- The continuous decreasing trend in the absolute Doppler Centroid frequency observed since June 2003 was corrected with the AOCS changes implemented on 11 December 2003. Please see figure 3.
- A Doppler discontinuity, previously observed daily at ~ 15:00 hours, has also been removed with the AOCS s/w upgrade. Please see figure 5.b and figure 6.b.

The plots of the figure 1 and figure 2 show the evolution of the Doppler centroid over the world for the last 35 days. No anomaly on the Doppler centroid distribution is noticed.

4.3 Absolute WV-IS2 Doppler Centroid evolution in time

5 IRF ANALYSIS

The analysis of the ASAR and Radarsat transponders is used to characterize the products in term of:

- ✓ spatial resolution,
- ✓ Impulse Response Function (IRF) parameters (PSLR, ISLR, SSLR) and
- ✓ Absolute calibration factor.

The analysis is performed for all the modes, beams and polarizations.
The Table 1 shows the relative Radar Cross Section (RCS)[1] per mode, beam and set of transponders. The values provided per sub-swath correspond to the mean absolute calibration error. Values provided per all swaths correspond to the mean error value and the corresponding standard deviation. **All values are in dB.**

6.2 History of elevation antenna pattern updates

The table below summarizes the evolution of the elevation antenna pattern used for processing since August 2002.
The files are available on line at **http://earth.esa.int/services/auxiliary_data/asar/**

The source information indicates whether the pattern has been derived from data acquired over the Rain Forest ("RF") or whether it has been derived from antenna synthesis using results from Module Stepping acquisitions ("SYN").

Please note that pre-launch antenna pattern where used before the first ASA_XCA_AX update.

Please note that the table indicates for each beam, in which file the update took place. Any file created after this date will include that update unless a new file is specified for the beam. For instance, the pattern for IS3_SS2 VV was updated on 27 August 2003. The file created on 9 December 2003 (when the IS1 VV pattern was updated) will include the same pattern for IS3_SS2 VV as in the file of 27 August 2003, since the table does no indicate any further update for the IS3_SS2 VV pattern.
