1 INTRODUCTION

The GOMOS monthly report documents the current status and recent changes to the GOMOS instrument, its data processing chain, and its data products.

The Monthly Report (hereafter MR) is composed of analysis results obtained by the Data Processing and Quality Control, combined with inputs received from the different entities working on GOMOS operation, calibration, product validation and data quality. These teams participate in the GOMOS Quality Working Group:

- European Space Agency (ESRIN, ESOC, ESTEC-PLSO)
- DPQC
- ACRI
- Service d'Aeronomie
- Finnish Meteorological Institute
- IASB-Belgian Institute for Space Aeronomy
- Astrium Space
- ECMWF

In addition, the group interfaces with the Atmospheric Chemistry Validation Team.

1.1 Scope

The main objective of the Monthly Report is to give, on a regular basis, the status of GOMOS instrument performance, data acquisition, results of anomaly investigations, calibration activities and validation campaigns. The following six sections compose the MR:

- Summary
- Unavailability
- Instrument Configuration and Performance
- Level 1 Product Quality Monitoring
- Level 2 Product Quality Monitoring
- Validation Activities and Results

2 SUMMARY

Operations (section 3.1): During the reporting month the instrument was working well without any unavailability period and without any occurrence of the VCCS anomaly.

Processor update (sections 5.1.1-5.1.2): On 8th August 2006 at 06:59:59 (Kiruna orbit 23206) the GOMOS processor was successfully switched from version GOMOS/4.02 to GOMOS/5.00. At the same time the majority of the auxiliary files have been updated. This new processor is in line with the prototype version used for the second reprocessing of the years 2002-2006 (until 4th July 2006) performed at ACRI. The consolidated level 2 data are available on the D-PAC server ttp://gomo2use@ftp-ops.de.envisat.esa.int whereas the level 1b data should be ordered through the EO Helpesk (EOHelp@esa.int). The reprocessed level 2 data are also available on the D-PAC server (2002-4th July 2006).

Data availability when instrument was in operation (section 3.4): for July/August the level 0 data availability is nominal (~99%). For level 1b the archived products are around 86% before 8th August 2006 (date of switch to version GOMOS/5.00) and around 95% after. The reason for the low statistics on level 1b products before 8th August (old version of GOMOS) is that the allocated processing time was lower than the real processing time with the result that the end of the orbit was systematically not processed. With the new version of the processor this problem seems to be solved.

Pointing performance (section 4.6.1): the SATU NEA ("Y" axis) has a gradual increase since mid April 2006. This increase is due to fluctuations of the SATU 'Y' data observed at the beginning of the occultations (starting at 130 km that corresponds to an elevation angle of around 65°). Preliminary investigations carried out by the ESL, ESA and industry point to a problem on the SFM (mechanical or electrical) and not to a problem on the SATU itself. Since mid June the increase was stable for a while at around 5.5 micro radians. The evolution of the anomaly can be summarized as follows:

- 1) Mid April mid June: gradual increase until 5.5 microrad (unknown reason of the fluctuations)
- 2) Mid June mid July: stability until mid July when it starts to decrease (unknown reason of less fluctuations)
- 3) Mid July end August: further decrease due to a change in the start altitude of the occultations, from nominal 130 km to 112.5 km
- 4) End August current date: increase to values found on period 2) due to change in start tangent altitude of the occultations, from 112.5 Km to nominal 130 km

The QWG has performed a study of the SATU Y anomaly evolution which is presented in section 4.6.1.1.

Temperatures (section 4.3): The CCD temperatures show the expected global increase due to the radiator ageing. Another expected variation of the temperatures, the seasonal one, with amplitude of around 0.8 degree can also be observed.

Modulation signal (section 4.5.2): The standard deviation of the modulation signal presents:

- High values during summer time. The South Atlantic Anomaly is now confirmed as the cause of these unexpected peaks. The quality of ESRIN data, in particular over the SAA zone, is impacted but the measure of this impact is under investigation. However, in the second half of October, the peaks are smaller because the DSA zone where the data are taken for this analysis is moving towards the Northern Hemisphere. At the end of October the DSA zone is definitely chosen by the planning system in the Northern Hemisphere (to fill the criteria 'DSA in full dark limb conditions') and the high peaks disappear.
- A small negative trend. The QWG team has checked if the trend observed has an impact on the GOMOS products quality. The conclusion is that the differences between the actual amplitudes and the values used in the data processing are too small to have a significant impact on the retrieval.

Star detection performance (section 4.6.3): the stars should be detected not far from the SATU center, that is, pixel number 145 in elevation and number 205 in azimuth. It has been observed that the azimuth MIP was within the threshold since September 2002 until the occurrence of the VCCS anomaly on January 2005. The reason for the change in trend observed after the anomaly is, at the moment, not understood. The elevation MIP had a significant variation until 12th December 2003 when a new PSO algorithm was activated in order to reduce the deviations of the ENVISAT platform attitude with respect to the nominal one. Similarly to the azimuth, after the anomaly of January 2005 the Elevation MIP has a drift that has no explanation. Investigations are ongoing to try to understand this behavior of the MIP as although it does not impact the data quality, it may invalidate attitude monitoring by GOMOS and could represent a hidden anomaly.

Radiometric sensitivity monitoring (section 5.4.1): for stars 25 and 9, the UV ratio is greater than the threshold 10%. It is clear that there is a global decrease of UV ratios for all the stars. This confirms the expected degradation suffered by the UV optics that is, anyway, very small considering also the small variation for the rest of the stars. For the photometers radiometric sensitivity ratios it is observed that every star has a variation that seems to be seasonally related. The variation is significant for stars 25 and 18. After some investigations performed by the QWG that exclude an inaccurate reflectivity correction LUT, it seems that the PH1/2 radiometric sensitivity variations could come from the fact that the spectrometers and the photometers are not illuminated the same way when the straylight appears.

Auxiliary Data File (sections 5.1.2 and 6.1.2): a new set of ADFs are in use since 8th August 2006. For details on the precise updates for every kind of file see section 5.1.2 and 6.1.2. An old map for DC correction has been used for some time periods between 8-11 AUG 2006, only for Near Real Time products (section 4.5.1).

3 INSTRUMENT UNAVAILABILITY

3.1 GOMOS Unavailability Periods

There were no instrument unavailability periods during the reporting month.

3.2 Stars Lost in Centering

The acquisition of a star initiates with a rallying phase where the telescope mechanism is directed towards the expected position of the star. Subsequently the acquisition procedure enters into detection mode, where the SATU star tracker output signal is pre-processed for spot presence survey and for the location of the most illuminated couple of adjacent pixels for two added lines, over the detection field. The Most Illuminated Pixel (MIP) defines the position of the first SATU centering window. The following step in the acquisition sequence is then initiated and consists of a centering phase where the SATU output signal is pre-processed for spot presence survey over the maximum of 10x10 pixel field. This allows the third phase to begin: the tracking phase.

The centering phase has occasionally resulted in loss of the star from the field of view. Fig. 3.2-1 reports the percentage of the stars lost in centering for the period 03-FEB-2003 to 25-JUN-2006. It can be seen that only three stars, mainly weak stars (higher star id means higher magnitude) are lost during the centering phase between 4 and 6 % of their planned observations. The star id 115 was lost almost 9% of the times but it was planned to be occulted twenty three times and was lost twice (in period 19-25 January 2004), so this percentage of loss is not statistically significant.

As the monitoring shows neither a trend nor excessively high percentages of loss, there is no need for the moment to reject any star from the catalogue, and there is no indication of instrument-related problems.

Now with the instrument in a new operation scenario, the stars are also lost due to the anomaly "elevation voice coil command saturation" even if the instrument is not going anymore to Stand by / Refuse mode (section 3.3).

6

Statistics on stars lost in centering: 03-FEB-2003 until 27-AUG-2006

Figure 3.2-1: Statistics on stars that have been lost during the centering phase. The number above the columns correspond to the Star ID

3.3 Stars lost due to VCCS anomaly

No VCCS anomalies occurred during the reporting period.

3.4 Data Generation Gaps

The trend in percentage of available data within the archives PDHS-K and PDHS-E is depicted in fig. 3.4-1 (when instrument was in operation). It is a good indicator on how the PDS chain is working in terms of generation and dissemination of data to the archives. The percentage is calculated once per week.

For July/August the level 0 data availability is nominal (~99%). For level 1b the archived products are around 86% before 8th August 2006 (date of switch to version GOMOS/5.00) and around 95% after. The reason for the low statistics on level 1b products before 8th August (old version of GOMOS) is that the allocated processing time was lower than the real processing time with the result that the end of the orbit was systematically not processed. With the new version of the processor this problem seems to be solved.

Figure 3.4-1: Percentage of level 0 and level 1b data availability on the archives PDHS-E and PDHS-K

3.4.1 LEVEL 0 PRODUCTS: GOM_NL__0P

Occultations planned to be acquired but for which no GOM_NL__0P data product has become available are presented in fig. 3.4-2 for the reporting period.

Figure 3.4-2: The pink lines are the orbit segments corresponding to planned data acquisitions for which no GOMOS level 0 product has become available

3.4.2 HIGHER LEVEL PRODUCTS

Routine dissemination of higher-level products produced by the PDS to the users is enabled. Reprocessed products (level 2) are available at D-PAC ftp server ftp-ops.de.envisat.esa.int from August 2002 to June 2006. Existing gaps will be covered by new products generated in 2006. The current processor GOMOS/5.00 in operation since 8th August 2006 that generates data in near real time is in line with the prototype used for the reprocessing.

4 INSTRUMENT CONFIGURATION AND PERFORMANCE

4.1 Instrument Operation and Configuration

4.1.1 OPERATIONS SINCE BEGINNING OF MISSION

During the period end of March 2003 to July 2003 the azimuth range had to be decreased in steps (table 4.1-1) to avoid an instrument problem ("Voice_coil_command_saturation" anomaly) that caused GOMOS to go into STAND BY/REFUSE mode. On July 2003 the driver assembly was switched to the redundant B-side and since that date the full azimuth range (-10.8, +90.8) was again available until the second major anomaly occurred on 25th January 2005. Between this date and until the instrument was declared operational again (29th August 2005), GOMOS has been operated for testing and anomaly investigation purposes in different operations scenarios. The changes in azimuth configuration during the whole mission until end of reporting period are summarized in table 4.1-1.

Minimum Maximum Orbit Date Comment Azimuth (°) Azimuth (°) 01-MAR-2002 -10.8+90.8 Nominal 29-MAR-2003 17:40 +90.8 5635 0.0 Reduced 31-MAY-2003 06:22 6530 +4.0+90.8 Reduced +90.8 16-JUN-2003 16:17 6765 +12.0Reduced 15-JUL-2003 01:39 +90.87200 -10.8Nominal Different 25-JAN-2005 23:33 15200 configuration for tests tests testing purposes 18280 29-AUG-2005 02:52 +10-10 Reduced 26-SEP-2005 01:32 18680 -5 +20Reduced 03-OCT-2005 01:12 18780 -5 +15Reduced -5 09-OCT-2005 21:30 18878 +20Reduced 12-MAR-2006 17:29 21080 +10 +35 Reduced 09-APR-2006 12:47 21480 +5 +30Reduced 16-APR-2006 15:48 21580 0 +25 Reduced 30-APR-2006 15:08 21780 -5 +20Reduced 07-MAY-2006 14:48 21880 0 +25Reduced 14-MAY-2006 14:28 21980 +15 +40 Reduced 28-MAY-2006 13:47 22180 +20+45Reduced 04-JUN-2006 13:27 22280 +15+40Reduced 18-JUN-2006 12:47 22480 +20 +45 Reduced 25-JUN-2006 12:27 22580 0 +25Reduced 02-JUL-2006 12:07 22680 -5 +20Reduced 16-JUL-2006 11:27 22880 0 +25 Reduced 23-JUL-2006 11:07 22980 +10+35 Reduced 06-AUG-2006 10:26 23180 Reduced 0 +25

Table 4.1-1: Historical changes in Azimuth configuration when GOMOS is in operations

4.1.2 CURRENT OPERATIONS AND CONFIGURATION

23480

27-AUG-2006 09:26

The start altitude of the occultations was reduced to 112.5 km for many occultations in order to avoid the SATU "Y" axis oscillations. The value of 112.5 was chosen after some tests performed using 117 and 121 km. When for an unknown reason the oscillations started to decrease then it was decided to place again the start of the occultation at the nominal altitude of 130 km (table 4.1-2).

+5

+30

Reduced

The planned GOMOS operations for the reporting period are identified in table 4.1-2. The operation scenario of GOMOS since 29th August 2005 until end of reporting month consists of:

- Planning 2 orbits per sequence (nominal were 5): this is done because in case of a voice coil failure with subsequent loss of star observation, the maximum loss of consecutive observations cannot exceed two orbits.
- Reduced azimuth field of view (nominal was [-10°, +90°]): as the anomaly occurs during the rallying of the telescope in the preparation for the star observation, it has been decided to reduce the field of

view in order to minimize the failure occurrence probability. Different ranges have been used during the reporting period (table 4.1-1) in order to optimize the number of occultations per orbit.

Table 4.1-2: GOMOS planned operations. The planning is built on a 2-orbit sequence basis (2 orbits with the same stars)

UTC Start	Start Orbit	Stop Orbit	Mode (<u>A</u> synchronous or <u>S</u> ynchronous)	Calibration (CAL) Dark Sky Area (DSA) or Nominal (Nom)

4.2 Limb, Illumination conditions and instrument gain setting

The **limb** and the **illumination condition** are two parameters that can confuse the user community. In table 4.2-1 there are specified the product parameter (level 1b and level 2 of processor GOMOS/4.02 operational until 8th August 2006) where the flag is located, the meaning and the source. The difference between the limb (SPH/bright_limb) and the illumination condition (SUMMARY_QUALITY/limb_flag) is that the first one is coming from the mission scenario and the second is coming from the processing (defined from the computation of the sun zenith and azimuth angles at both instrument and tangent point locations). The SPH/bright limb is for some occultations set to "dark" in the mission scenario while they are in fact in

bright limb illumination conditions. To select the highest quality data for scientific applications, data with SUMMARY_QUALITY/limb_flag equal to '0' should be used (see also the disclaimer: http://envisat.esa.int/dataproducts/availability/disclaimers). The instrument gain settings are also specified in table 4.2-1 (they depend on the mission scenario flags) just for completeness of information.

		/		
_	SPH/bright_limb	0 = Dark	1 = Bright	Coming from mission scenario
Products parameter	SUMMARY_QUALITY/limb_flag	0 = Full Dark 1 = Bright 2 = Twilight	1 = Bright 2 = Twilight	In the geolocation process the sun zenith angle is computed and the occultation then is flagged accordingly
ument	SPA Gain	3 (2)	0	Gain setting for spectrometer A. In parenthesis, values valid only for Sirius occultations (starID=1)
Instr Gain	SPB Gain	0	0	Gain setting for spectrometer B

Table 4.2-1: Relationship between limb, illumination condition flags and instrument gain settings (IPF version GOMOS/4.02 operational until 8 August 2006)

The same is valid for the prototype version GOPR_6.0a_6.0a and following ones (including the one that is used for the on-going second reprocessing of 2002-2005 years), where the **limb** is in fields SPH/bright_limb and SUMMARY_QUALITY/dark_bright_limb and the **illumination condition** is in field SUMMARY_QUALITY/obs_ill_cond. For these prototypes **and the processor GOMOS/5.00** in **operations since 8**th **August 2006**, the illumination condition can have five values (see table 4.2-2).

Table 4.2-2: Relationship between limb, illumination condition flags and instrument gain settings (prototype version GOPR 6.0a 6.0a and following ones)

	SPH/bright_limb SUMMARY_QUALITY/dark_bright_limb	0 = Dark	1 = Bright	Coming from mission scenario
Products	SUMMARY_QUALITY/obs_ill_cond	0 = Full 1 = Bri 2 = Tw 3 = Str 4 = Tw	ght rilight	In the geolocation process the sun zenith angle is computed and the occultation is then flagged accordingly
Instrume nt Gain	SPA Gain	3 (2)	0	Gain setting for spectrometer A. In parenthesis, values valid only for Sirius occultations (starID=1)
Ins	SPB Gain	0	0	Gain setting for spectrometer B

4.3 Thermal Performance

Since the beginning of the mission, the hot pixel and RTS phenomena have been producing a continuous increase of the dark charge signal within the CCD detectors (see section 4.5.1). In order to minimize this effect, three successive CCD cool downs were performed in orbits 800 (25th April 2002), 1050 (13th May 2002) and 2780 (11th September 2002) with a total decrease in temperature of 14 degrees.

Fig. 4.3-1 and 4.3-2 display, respectively, the overall temperature variation and the temperature variation around the Ascending Node Crossing (ANX) time with a resolution of 0.4 degrees (coding accuracy for level 0 data). The CCD temperatures show the expected global increase due to the radiator ageing.

Figure 4.3-1: Level 0 temperature evolution of all GOMOS CCD detectors since October 2002 until the end of the reporting period

Another expected variation of the temperatures, the seasonal one, with amplitude of around 0.8 degrees, can be also observed. The peaks that occur mainly in spectrometer B1 and B2 are also to be noted. They happen a little before the ANX for some consecutive orbits and every 8-10 days. Their origin is not known, as we did not find any correlation between these peaks and other activities carried out by other ENVISAT instruments. The CCD temperature at almost the same latitude location (fig. 4.3-2) is monitored in order to detect any inter-orbital temperature variation. The abnormal decreases observed sometimes in all detectors

are after GOMOS switch off periods, when the instrument did not have enough time to reach the nominal temperature before starting the measurements.

Figure 4.3-2: Level 0 temperature evolution of all GOMOS CCD detectors around ANX since November 2002 until the end of the reporting period

During July/August 2006, the orbital temperature variation of the detector SPB2 for ascending and descending passes (fig. 4.3-3 and 4.3-4) is nominal, around 2.5-3 degrees. The stability of the temperature during the orbit is important because it affects the position of the interference patterns. The phenomenon of the interference is present mainly in SPB and this Pixel Response Non-Uniformity (PRNU) is corrected during the processing.

Figure 4.3-3: Ascending orbital variation of SPB2 temperature during reporting period

Figure 4.3-4: Descending orbital variation of SPB2 temperature during reporting period

4.4 Optomechanical Performance

New band setting calibration has been performed during the reporting period.

- Version GOMOS/4.00 and previous ones: in the GOMOS processor versions GOMOS/4.00 and previous, the spectra are expected to be aligned along CCD lines, and therefore use only a single average line index per CCD. In table 4.4-1, the mean values of the location of the star signal for all the calibration analysis done is reported. The 'left' and 'right' values are calculated (the whole interval is not used) because the spectra present a slight slope, more pronounced in spectrometer B (see fig. 4.4-1). In table 4.4-2, mean values of the location of the star signal are calculated for some specific wavelength intervals. These intervals have been changed between the calibration performed in September 2002 and the ones performed afterwards (until November 2003). Table 4.4-3 reports the average location of the star spot on the photometer 1 and 2 CCD.
- Version GOMOS/4.02: in this processor version (GOMOS/4.02) operational since 23rd March 2004 to 8th August 2006, a Look Up Table (LUT) gives the line index of the spectra location as a function of the wavelength. However this characterization curve is not exactly the location of the star spectrum on the CCD but rather a combination of this position and some artefact created by the shape of the instrument optical point spread function (PSF). The exact shape is actually a straight line (especially for SPB) that has been characterised in 2005.
- Current version GOMOS/5.00 (since 8th August 2006): the exact shape of the CCD spectra location curve (which is a straight line) that has been characterised in 2005 was implemented in the current set of GOMOS ADFs. The position of the spectra convoluted with the PSF is calculated during the processing.

Table 4.4-1: Mean value of the location of the star signal during the occultation at the edges of every band (mean over 50 values, filtering the outliers)

	UV (SPA1) left/right	VIS (SPA2) left/right (Inverted spectra)	IR1 (SPB1) left/right	IR2 (SPB2) left/right
11/09/2002	80.7/80.7	79.8/79.5	82.8/81.9	83.1/82.1

4.5 Electronic Performance

4.5.1 DARK CHARGE EVOLUTION AND TREND

The trend of Dark Charge (DC) is of crucial importance for the final quality of the products, and is therefore subject to intense monitoring. As part of the DC there is:

- "Hot pixels", a pixel is "hot" when its dark charge exceeds its value measured on ground, at the same temperature, by a significant amount.
- RTS phenomenon (Random Telegraphic Signal), it is an abrupt change (positive or negative) of the CCD pixel signal, random in time, affecting only the DC part of the signal and not the photon generated signal.

The temperature dependence of the DC would make this parameter a good indicator of the DC behaviour, but the hot pixels and the RTS are producing a continuous increase of the DC (see trend in fig. 4.5-1 and 4.5-2). To take into account these phenomena, since version GOMOS/4.00 (the current one is GOMOS/4.02) a DC map per orbit is extracted from a Dark Sky Area (DSA) observation performed around

ANX (full dark conditions). For every level 1b product (occultation), the actual thermistor temperature of the CCD is used to convert the DC map measured around ANX into an estimate of the DC at the time (and different temperature) of the actual occultation. When the DSA observation is not available, the DC map inside the calibration product that was measured at a given thermistor reference temperature is used; again, the actual thermistor temperature of the CCD is used to compute the actual map. Table 4.5-1 reports the list of products that used the DC maps inside the calibration file due to the non-availability of DSA observation. A "CAL DC map with no T dep." means that, as the temperature information was not available for that occultation, the DC map used is exactly the one inside the Calibration product.

The "quality ranking" of the products depending on DC correction performed is as follows:

- Best quality: products with DC correction using DSA observation inside the orbit
- Less quality than previous ones: products with DC correction using the map inside the calibration product, thermal corrected ('DC map used' in table 4.5-1)
- Less quality than previous ones: products with DC correction using the map inside the calibration product, no thermal corrected ('DC map with no T dep.' in table 4.5-1)

Table 4.5-1: Table of level 1b products that used the Calibration DC maps instead of the DSA observation (1July -7 August 2006, GOMOS/4.02)

The average DC inserted by the processor into the level 1b data products for the spectrometers SPA1 and SPB2 (per band: upper, central and lower) is plotted in fig. 4.5-1 and 4.5-2. From the figures, it can be noted that the DC is increasing at a slightly higher rate than for previous years: 500 electrons per year for SPA1 and 700 electrons per year for SPB2.

The same DC values are plotted in fig. 4.5-3 but for some occultations belonging only to the reporting month.

Figure 4.5-1: Mean DC evolution on SPA1 since 15th December 2002 until the end of the reporting period

Figure 4.5-2: Mean DC evolution on SPB2 from 15th December 2002 until the end of the reporting period

By looking to fig. 4.5-3 there are two remarks to do:

- Strange DC values on 14-AUG-2006: very high for SPA2 (more than 5000 e), low for SPA1...The reason is that the DC used for the correction is taken from a DSA in bright limb. As should be. the occultations included in the level it GOM NL 0PNPDE20060814 021120 000059632050 00189 23289 0418.N1 have used a map, for the DC correction, extracted from the DSA included in this level 0 file. The problem is that this DSA is, by chance, the last DSA taken during the calibration sequence (orbits 23282-23289) and it is in bright limb which means that it is far from dark conditions needed for DC correction. Therefore all occultations belonging to that level 0 file used a wrong DC correction. The problem is not critical because there are few occultations in that level 0 file and the most of them are in straylight or bright limb conditions. Only one product in dark is affected by this problem.
- There are quite low values of DC for some periods of time between 8-11 AUG 2006. This is because the DC used when the DSA measurements were not available in the level 0 file, is the one taken from a GOM_CAL_AX with DC maps very old. This situation lasted until we have delivered a new GOM_CAL_AX with updated DC maps on 11-AUG-2006. The periods affected (only in Near Real Time data) are:

08-AUG-2006: 19:43:38 - 20:50:00 orbit 23214 09-AUG-2006: 20:52:44 - 22:05:00 orbit 23229 10-AUG-2006: 20:21:13 - 21:32:15 orbit 23243 11-AUG-2006: 19:49:41 - 20:56:00 orbit 23257

The data has been reprocessed and can be requested via EOHelp.

Figure 4.5-3: Mean Dark Charge of spectrometers during the reporting period

4.5.2 SIGNAL MODULATION

A parasitic signal was found to be systematically present, added to the useful signal, for the spectrometers A and B. The modulation is corrected in the data processing for spectrometers A1 and A2 (for spectrometer B it has much smaller amplitude and so is not corrected) and the modulation signal standard deviation is routinely monitored in order to detect any trend (fig. 4.5-4).

The modulation standard deviation, for every spectrometer, is characterised as follows:

$$\sigma_{\text{mod}} = (\text{`static noises'} - \text{`total static variance'})^{1/2} / \text{gain}$$
 (in ADU)

- The 'static noises' are calculated from the DSA observation performed once per orbit
- The 'total static variance' is obtained from ADF data (electronic chain noise, quantization noise).

The standard deviation of the modulation signal (fig. 4.5-4) shows high values during summer time for the ESRIN data, it now being confirmed that the South Atlantic Anomaly is the cause of these unexpected peaks. The quality of ESRIN data, in particular over the SAA zone, is impacted but the measure of this impact is under investigation. However, in the second half of October (both 2004 and 2005) the peaks are

smaller because the DSA zone where the data are taken for this analysis is moving towards the Northern Hemisphere. At the end of October the DSA zone is definitely chosen by the planning system in the Northern Hemisphere (to fill the criteria 'DSA in full dark limb conditions') and the high peaks disappear.

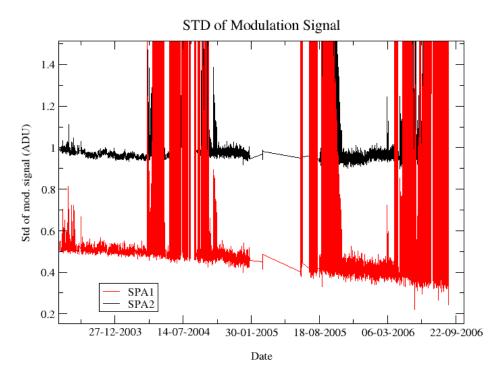

Figure 4.5-4: Standard deviation of the modulation signal

The QWG team has checked if the trend observed in fig. 4.5-4 has an impact on the GOMOS products quality. To do so, the trend in the amplitude of the signal modulation has been computed for several DSA acquired between 2002 and 2006 using the method described in ref. [3] which is the method used in the current GOMOS data processing.

The amplitude of the modulation is computed for each spectrum of a DSA by averaging pixels modulo 4. The median value of this amplitude is plotted on fig. 4.5-5 for spectrometers A1 and A2 and for the upper, the central and the lower bands. The evolution is very similar in the 3 bands. It is thus possible to combine the 3 bands to obtain a better estimation of the trend (fig. 4.5-6). It is clear in this plot that there is not only a positive trend but also oscillations around the linear trend. In order to be comparable to these results, the *standard deviation (STD) of the modulation signal* reported on fig. 4.5-4 should be multiplied by 2^{1/2} because 50% of the pixels have a zero modulation (25% a positive modulation, 25% a negative modulation) and are taken into account for the computation of the STD.

Despite the small number of processed DSA, it is possible to derive some preliminary conclusions. We observe:

- a small short-term dispersion, smaller for the spectrometer A2 (0.02 ADU peak to peak) than for the spectrometer A1 (0.04 ADU peak to peak)
- a small positive trend for the spectrometers A1 and A2 ($\sim +10^{-6}$ /orbit)

• the mean values are about 1.42 ADU for the spectrometer A1 and 0.79 for the spectrometer A2, slightly larger than the ones used in the current GOMOS data processing: 1.40 for the spectrometer A1 and 0.76 for the spectrometer A2.

The differences between the actual amplitudes and the values used in the data processing are too small to have a significant impact on the retrieval.

Figure 4.5-5: Observed amplitude of the modulation for spectrometer A1 (left column) and spectrometer A2 (right column) in upper (top row), central (middle row) and lower bands (bottom row) using a small set of DSA

Figure 4.5-6: Observed amplitude of the modulation for spectrometer A1 (top figure) and spectrometer A2 (bottom figure) averaged in 3 bands and using a larger number of DSA than for results presented in fig. 4.5-5

4.5.3 ELECTRONIC CHAIN GAIN AND OFFSET

No new electronic chain gain and offset calibration has been done during the reporting period so the results have been presented in previous MR.

The routine monitoring of the ADC offset is a good indicator of the ageing of the instrument electronics. During November 2005 an exercise has been done to analyze the variation of the ADC offset using the calibration observation in linearity mode performed on 28th November 2005.

The fig. 4.5-7 presents the evolution of the calibrated ADC offset for each spectrometer electronic chain. The unexpected increase of this offset seems to be due to an external contribution. In the ADC offset calibration procedure, linearity observations are used with two integration times of 0.25 and 0.50 seconds to extrapolate to an integration time of 0 seconds that gives the complete chain offset and not only the ADC offset. The complete offset contains any possible offsets, and especially the static dark charge (i.e. the dark charge that does not depend on the spectrometer integration time). If the memory area of the CCD is affected by the generation of hot pixels (this is confirmed by the presence of vertical lines visible in the measurement maps in spatial spread monitoring mode), it can be concluded that the increase observed in fig. 4.5-5 is due to these new hot pixels.

Figure 4.5-7: Evolution of the ADC offset for each spectrometer electronic chain

A current QWG task consists in completing the analysis to confirm that the offset increase is due to the dark charge increase in the memory area. This can be proven by the study of the noise due to the increased dark charge. The increase of ADC offset will be assumed to be equal to the increase of 'static dark charge' and the corresponding noise will be computed and compared to the increase of the residual of the signal variance.

If we keep the ADC offset constant, as it is also used to compute the dark charge at band level (which is used to correct the samples in the level 1b processing), the increase of the static dark charge - not taken into account in the ADC offset - is compensated by an artificial increase of the calibrated dark charge. So, the star and limb spectra are correctly corrected for dark charge. A small bias can be added to the instrument noise due to the incorrect dark charge level. Anyway, this quantity is not large enough to require a modification of the ADC offset value.

4.6 Acquisition, Detection and Pointing Performance

4.6.1 SATU NOISE EQUIVALENT ANGLE

The Star Acquisition and Tracking Unit (SATU) noise equivalent angle (SATU NEA) consists of the statistical angular variation of the SATU data above the atmosphere. The mean of the standard deviation (STD over the 50 values per measurement) above 105 km are computed for every occultation, giving two values per occultation: one in the 'X' direction, one in the 'Y' direction. A mean value per day in every direction and limb is calculated and monitored in order to assess instrument performance in terms of star

pointing (fig. 4.6-1, upper). Also monthly averages are calculated and plotted (fig. 4.6-2). The thresholds are 2 and 3 micro radians in 'X' and 'Y' directions respectively. Before May 2003, data above 90 km have been considered (instead of 105 km) but from May 2003 on, data taken in the mesospheric oxygen layer (located around 100 km altitude) have been avoided because they could cause fluctuations on the SATU data. Also the products with errors (error flag set) are discarded from May 2003 onwards.

As can be seen in fig. 4-6.1-upper, the SATU NEA had a sudden increase on 8th September 2005 mainly in 'Y' axis. These values remained high, fluctuating between 1 and 1.8 microrad until December 2005 when they came back to the values they used to be before the increase of September. The reason why there was higher noise in the data causing the jump in daily SATU average is not known.

Now a different problem has been present since mid April 2006. A gradual increase of the daily SATU Y mean is observed. This increase is due to fluctuations of the SATU 'Y' data observed at the beginning of the occultations (starting at 130 km that corresponds to an elevation angle of around 65°). Preliminary investigations carried out by the ESL, ESA and industry point to a problem on the SFM (mechanical or electrical) and not to a problem on the SATU itself. Since mid June the increase was stable for a while at around 5.5 micro radians. The evolution of the anomaly can be summarized as follows:

- 1) Mid April mid June: gradual increase until 5.5 microrad (unknown reason of the fluctuations)
- 2) Mid June mid July: stability until mid July when it starts to decrease (unknown reason of less fluctuations)
- 3) Mid July end August: further decrease due to a change in the start altitude of the occultations, from nominal 130 km to 112.5 km
- 4) End August current date: increase to values found on period 2) due to change in start tangent altitude of the occultations, from 112.5 Km to nominal 130 km

Figure 4.6-1: Average value per day of SATU NEA STD above 105 km

The results for some occultations belonging to previous months (monthly averages) are presented in fig. 4.6-2, where the change in trend in September 2005 and May 2006, mainly for the 'Y' axis is visible.

Figure 4.6-2: Average value per month of SATU NEA STD above 105 km

4.6.1.1 Study of SATU Y anomaly evolution (QWG)

The SATU Y data as a function of the elevation are plotted on fig. 6.4.1.1-a for all occultations of star S009 measured since orbit 22600 (26 June 2006). Several interesting features may be noticed. The amplitude of the anomaly is globally decreasing (for the star S009). A large drop in the amplitude occurred around 10 July 2006, the origin of this drop being unexplained for now. However, the "contaminated" elevation range seems to increase. The SATU Y data plotted for three individual occultations of star S009 (26 June 2006, 1 July 2006, and 15 July 2006) also illustrate these observations (fig. 6.4.1.1-b). It is worth noting that the SATU elevation data in the first part of the occultation are now between $-5 \mu rad$ and $+5 \mu rad$ (i.e. within the range allowed by the instrument specification).

Fig. 6.4.1.1-a also highlights the presence of some structures with a small amplitude in the elevation range between 63.6° and 64.1°. For the elevation values smaller than 63.6°, the data are dominated by angular scintillation.

The time evolution of the SATU elevation will be investigated on a longer period in order to track the appearance of the anomaly and to further investigate its evolution.

Figure 4.6.1.1-a: SATU Y data (µrad) as a function of the elevation (°) for all occultations of star S009 measured between orbits 22600 and 23500

Figure 4.6.1.1-b: SATU Y data (μ rad) vs SFA elevation angle (°) for three occultations of star S009 on 1 July 2006, 15 July 2006 and 30 August 2006

4.6.2 TRACKING LOSS INFORMATION

This verification consists of the monitoring of the tangent altitude at which the star is lost. It is an indicator of the pointing performance although it is to be considered that star tracking is also lost due to the presence of clouds and hence not only due to deficiencies in the pointing performance. Therefore, only the detection of any systematic long-term trend is the main purpose of this monitoring. The recent results are presented in fig. 4.6-3 and 4.6-4:

- The dependence of the altitude at which tracking is lost on the magnitude of the star is very small because the tracking is mainly lost due to the refraction and the scintillation that depend on the atmospheric conditions.
- The azimuth of some stars could be very near to the reduced instrument azimuth edges and therefore there could be occultations planned to have a duration very small (2, 6, 10...seconds). To avoid

- planning this kind of useless occultation, it has been decided to set the minimum occultation duration value to 25 seconds. Fig. 4.6-3 and 4.6-4 (dark and bright limb) shows stars lost at altitudes higher than 30 km which corresponds with durations around 25-35 seconds.
- In bright limb it is not expected that the stars are lost at very low altitudes due to the amount of light arriving to the pointing system mainly when the refraction effects start to be important. We see from fig. 4.6-4 that there are few stars lost at altitudes around 4 km. This occurs when the pointing system is not able to point to the star anymore but, instead of finishing the occultation, it continues to track light until the planned duration is reached.
- Daily statistics are given in fig. 4.6-5 (calculated using 50 products per day). The high peaks in standard deviation before 25th January 2005 are due to the long lasting occultations or partial occultations (the entire occultation is included within the following orbit data). The ones during June/July/August 2005 are due to the tests performed for the anomaly investigation. After 29th August (GOMOS operational again) the peaks are due to the "short occultations".
- Monthly statistics are given in fig. 4.6-6 (calculated using 50 products per day) where the change in trends, mainly for dark limb, is visible for the period of GOMOS testing.

Figure 4.6-3: Last tangent altitude of the occultation (dark limb), point at which the star is lost

Figure 4.6-4: Last tangent altitude of the occultation (bright limb), point at which the star is lost

Figure 4.6-5: Daily average and STD of tangent altitude loss for the reporting period

Figure 4.6-6: Monthly mean tangent altitude (and STD) at which the star is lost since January 2003

4.6.3 MOST ILLUMINATED PIXEL (MIP)

The MIP (Most Illuminated Pixel) is the star position on the SATU CCD in detection mode and it is recorded in the housekeeping data. The nominal centre of the SATU is pixel number **145** in elevation and number **205** in azimuth. The detection of the stars should not be far from this centre. As it can be seen in fig. 4.6-7 the **azimuth MIP** was within the threshold (table 4.6-1) since September 2002 until the occurrence of the anomaly on January 2005, even if a small variation is present. The reason for the change in trend observed after the anomaly is, at the moment, not understood. The **elevation MIP** had a significant variation (see the *note* below) until 12th December 2003 when a new PSO algorithm was activated in order to reduce the deviations of the ENVISAT platform attitude with respect to the nominal one. Similarly to the azimuth, after the anomaly of January 2005 the Elevation MIP has a drift that has no explanation. Investigations are ongoing to try to understand this behavior of the MIP as, although it does not impact the data quality or the star location on the CCD array during the measurements, it may invalidate attitude monitoring by GOMOS and could represent a hidden anomaly.

Note: A MIP variation onto the SATU CCD of 50 pixels corresponds to a de-pointing of 0.1 degrees

Table 4.6-1: MIP Thresholds

MIP X	Mean delta Az	[198 - 210]
	Std delta Az	7
MIP Y	Mean delta El	[140 - 150]
	Std delta El	4

Figure 4.6-7: Mean values of MIP for some orbits since 1st September 2002 (see table 4.6-1)

Fig. 4.6-8 shows the standard deviation of azimuth and elevation MIP that should be within the thresholds of table 4.6-1. The peaks observed mean that one (or more) stars were detected very far from the SATU detection point and, in this case, the stars were lost during the centering phase (see section 3.2 for stars lost in centering).

Figure 4.6-8: Standard deviation of MIP Azimuth and Elevation for some orbits since 1st September 2002 until end of reporting period (see table 4.6-1)

5 LEVEL 1 PRODUCT QUALITY MONITORING

5.1 Processor Configuration

5.1.1 VERSION

About 25% of near real time GOM_TRA_1P products have been received by the DPQC team for routine quality control and long term trend quality monitoring. The current level 1-processor software version for the operational ground segment is GOMOS/5.00 since 8th August 2006 (see table 5.1-1). The product specification is PO-RS-MDA-GS2009_10_3I. This processor has been cleared for initial level 1 data release, with a disclaimer for known artefacts (http://envisat.esa.int/dataproducts/availability/disclaimers) that are currently being resolved and will be implemented in following releases of the processor (http://envisat.esa.int/dataproducts/availability).

Table 5.1-1: PDS level 1b product version and main modifications implemented

Date	Version	Description of changes
08-AUG-2006	Level 1b version 5.00 at PDHS-E, PDHS-K	 Algorithm baseline level 1b DPM 6.3 Correction of FP unfolding algorithm Background correction of SPB in full dark limb Modification of the computation of the incidence angle Correction of the flat-field correction equations Star spectrum location on CCD modified for SPB Provide SFA and SATU angles in degrees Elevation angle dependency of the reflectivity LUT added in the algorithms Ratio upper/star signal added (FLAGUC) Add Dark Charge used for dark charge correction (per band) Flag for illumination condition (PCDillum) Minimum sample value for which the cosmic rays detection processing is applied (Crmin) is a function of
23-JUL-2006	Level 1b version 5.00 at LRAC	gain index • Logic for computation of the flags attached to the reference star spectrum (Flref) modified • Add the computation of the sun direction in the inertial geocentric frame to be written in the level 1b and limb products. • Spectrometer effective sampling time added Change in configuration at the time of switch over: • Use of new reflectivity LUT (GOM_CAL_AX) • New wavelength assignment for SPA1, A2, B1 (GOM_CAL_AX) • Location of star spectrum projection on the CCD arrays (GOM_CAL_AX) • Spatial PSF of SPB modified (GOM_INS_AX) • Some universal constants (GOM_PR1_AX)
23-MAR-2004	Level 1b version 4.02 at PDHS-E and PDHS-K	Algorithm baseline level 1b DPM 6.0 Adding a new calibration parameters (these values are hard coded at the moment) Removal of redundancy chain from code

		 Modifications in the processing to apply new configuration and calibration parameter New algorithm to determine between dark, twilight and bright limb and to handle data accordingly Added handling of source packages with invalid packet header Added enumerations for all configuration flags
31-MAY-2003	Level 1b version 4.00 at PDHS-E and PDHS-K	 Algorithm baseline level 1b DPM 5.4: Modulation correction step added after the cosmic rays detection processing Inversion of the non-linearity and offset corrections Modification of the computation of the estimated background signal measured by the photometers: use the spectrometer radiometric sensitivity curve and the photometer transfer function. Use of the dark charge map at orbit level computed from the DSA (dark sky area) if any in the level 0 product Implementation of a new unfolding algorithm for the photometer samples
21-NOV-2002	Level 1b version 3.61 at PDHS-E and PDHS-K	Algorithm baseline DPM 5.3: Review of some default values New definition of one PCD flag (atmosphere) Temporal interpolation of ECMWF data

Users are supplied with 2002 - 4th July 2006 data sets reprocessed by the last prototype processor GOPR_6.0c_6.0f developed and operated by ACRI. See table 5.1-2 for prototype level 1b versions and modifications. The current GOMOS operational ground segment version GOMOS/5.00 is line with the prototype version used for this second reprocessing.

Table 5.1-2: GOPR level 1b product version and main modifications implemented

Date	Version	Description of changes
22-JUL-2005	GOPR_6.0c	 Level 1b: Correction of FP unfolding algorithm Background correction of SPB in full dark limb Modification of the computation of the incidence angle Correction of the flat-field correction equations Star spectrum location on CCD modified for SPB Configuration for second reprocessing: Use of new reflectivity LUT New wavelength assignment for SPA1, A2, B1 Spatial PSF of SPB modified
17-MAR-2004	GOPR 6.0a	 Provide SFA and SATU angles in degrees Elevation angle dependency of the reflectivity LUT added in the algorithms Ratio upper/star signal added (FLAGUC) Add Dark Charge used for dark charge correction (per band) Flag for illumination condition (PCDillum) Minimum sample value for which the cosmic rays detection processing is applied (Crmin) is a function of gain index

		 Logic for computation of the flags attached to the reference star spectrum (Flref) modified
		 Add the computation of the sun direction in the inertial geocentric frame to be written in the level 1b and limb products.
		Spectrometer effective sampling time added
25-JUL-2003	GOPR 5.4f	The demodulation process is applied only in full dark limb and twilight limb conditions.
17-JUL-2003	GOPR 5.4e	 Sun zenith angle is computed in the geolocation process. The occultation is now classified into (0) full dark limb condition, (1) bright limb condition and (2) twilight limb condition. No background correction applied in full dark limb condition. The location of the image of the star spectrum on the CCD array is no more aligned with the CCD lines.
02-JUL2003	GOPR 5.4d	The maximum number of measurements is set to 509 (instead of 510) in the GOPR prototype.
17-MAR-2003	GOPR 5.4c	 Modification of the CAL ADFs (update of the limb radiometric LUT). The products are affected only if the limb spectra are converted into physical units Modifications to allow compatibility with ACRI computational cluster (no modifications of the results) Modification of the logic to handle dark charge map refresh at orbit level (DSA data is now directly processed by the level 1b processor if available in the level 0 product). No impact on the results
21-FEB-2003	GOPR 5.4b	 DC map values are rounded when written in the level 1b product Modification of the CAL ADFs (update of the wavelength assignment of SPB1 and SPB2) Modify the computation of flag_mod in the modulation correction routine
17-JAN-2003	GOPR 5.4a	 use the start and stop dates of the occultation when calling the CFI nterpol instead of start and stop dates of the level 0 product modify the ECMWF filename information in the SPH of the level 1b and limb products

5.1.2 AUXILIARY DATA FILES (ADF)

The ADF's files in tables 5.1-3, 5.1-4, 5.1-5, 5.1-6 and 5.1-7 have been disseminated to the PDS during the whole mission. Note that the files outlined in yellow are the set of auxiliary files used during the reporting period. For every type of file, the validity runs from the start validity time until the start validity time of the following one, but if an ADF file has been disseminated after the start validity time, it is obvious that it will be used by the PDHS-E and PDHS-K PDS only after the dissemination time (this happens the majority of the time). Just like the other ADF's, the calibration auxiliary file (GOM_CAL_AX) has been updated several times in the past (table 5.1-7) but the difference is that now it is updated in a weekly basis with only new DC maps, and that is why the files used during July/August 2006 are reported in a separate table (table 5.1-8) that changes from report to report.

Table 5.1-3: Table of historic GOM_PR1_AX files used by PDS for level 1b products generation. The GOM_PR1_AX is a file containing the configuration parameters used for processing from level 0 to level 1b products

products generation in period

5.2 Quality Flags Monitoring

18-AUG-2006 → 25-AUG-2006

26-AUG-2006

In order to provide a reasonable number of plots, only data after the switch over on 8th August have been used.

(orbit 23323, 17-AUG-2006)

(orbit 23442, date 24 AUG 2006)

GOM CAL AXVIEC20060817 094138 20060816 000000 20100101 000000

GOM CAL AXVIEC20060825 091604 20060823 000000 20100101 000000

In this section, the results of monitoring some Product Quality information stored in level 1b products that did not have a fatal error (MPH error flag not set) are discussed. The products with fatal errors were around 9% of the products received during the reporting month for the quality monitoring.

On the one hand, for every product we have information of the **number of measurements** where a given problem was detected (i.e. number of invalid measurements, number of measurements containing saturated samples, number of measurements with demodulation flag set...). On the other hand, there are **flags** that indicate problems within the product (i.e. flag set to one if the reference spectrum was computed from DB, flag set to zero if SATU data were not used...).

For the information on the number of measurements a plot of percentages with respect to time is provided in fig. 5.2-1. The most relevant part of this information is also plotted in a world map as a function of ENVISAT position: % of cosmic ray hits per profile, % of datation errors per profile, % of star falling outside the central band per profile and % of saturation errors per profile (fig.5-2.2).

It can be seen from fig. 5.2-1 that the cosmic rays hits occurred several times for the 95% of the measurements of the products. Looking at fig. 5.2-2 it can be clearly observed that this high percentage occurred when the satellite crossed the South Atlantic Anomaly (SAA) zone. Also the percentage of saturation errors per profile shows an increase over the SAA zone.

Figure 5.2-1: Level 1b product quality monitoring with respect to time

Figure 5.2-2: Level 1b product quality monitoring with respect to geolocation of ENVISAT

Another observation from fig. 5.2-1 is that for many products, 20-25% of the measurements have the star signal falling outside the central band. In fig. 5.2-2 it is observed that this percentage occurred mainly during twilight/dark conditions while in bright conditions the percentage is around 10% (fig.5.2-2). This is because during the night the stars are lost deeper within the atmosphere and the turbulence phenomena becomes more important, producing the star to be less 'focused' on the spectrometers central band.

The other values (% of invalid measurements per product, % of measurements per product with datation errors...) are quite low.

The flag information is given in table 5.2-1. The percentage of the products that have at least one measurement with demodulation flag set is also reported.

At least one measurement with demodulation flag set:	28 %
Reference spectrum computed from DB:	0.0 %
Reference spectrum with small number of measurements:	0.0 %
SATU data not used:	0.0 %

Table 5.2-1: Percentage of products during the reporting period with:

5.2.1 QUALITY FLAGS MONITORING (EXTRACTED FROM LEVEL 2 PRODUCTS)

In order to provide a reasonable number of plots, only data after the switch over on 8th August have been used.

In this section, the Product Quality information coming from the level 1 processing that is also stored in the level 2 products is plotted. Only products that did not have a fatal error (MPH error flag not set) are considered. The purpose of using the level 2 data is simply that the percentage of level 2 products arriving to the DPQC team for the quality monitoring is much higher. For the reporting month, 89% of the archived products have been received. The plots are very similar to fig. 5.2-1 and 5.2-2 (demodulation flag information is not included) but separating ascending from descending passes. Since this monthly report the table informing on "*latitude of the different limb illumination in ascending and descending passes*" is not anymore provided because within this new version of the processor (GOMOS/5.00) there is no correspondence between illumination condition and latitude range when separating the passages (ascending and descending). Now, in the geolocation process, the sun zenith angle is computed and the occultation is then flagged accordingly (dark, bright, twilight, straylight, twilight+straylight). You can see in fig. 5.2-3 the location of the occultations and their limb.

Fig. 5.2-4 and 5.2-5 present some quality information as a function of the time whereas in fig. 5.2-6 and 5.2-7 the plot is respect to the satellite position at the beginning of the occultations.

In ascending (fig. 5.2-4) the percentage of measurements "where a problem occurred during the full transmission" per product is around 2% while for the descending passes (fig. 5.2-5) is around 10% at the beginning of the reporting period and around 50% at the end of August. This is due to the saturation that

occurs mainly in bright limb. In dark limb the saturation occurs over the SAA zone but it is quite low elsewhere. From fig. 5.2-4 and 5.2-5 you can see also that there are a variable percentage of the measurements that have the star signal falling outside the central band. This is because in dark the stars are lost deeper within the atmosphere and the turbulence phenomena become more important, resulting in the star being less 'focused' on the spectrometers central band.

In ascending (fig. 5.2-6) the SAA is perfectly localized by the high percentage of cosmic ray hits per product (upper left panel). It is not the same if we look at fig. 5.2-7, because in descending most of the occultations in that world region are in bright limb conditions and the cosmic rays detection processing is not activated.

Figure 5.2-7: Level 1b product quality monitoring with respect to geo-location for <u>DESCENDING</u> ENVISAT passes

5.3 Spectral Performance

In previous spectral calibration exercises the results exceeded the warning value which is 0.07 nm (fig. 5.3-1). Since 8th August 2006, in parallel to the switch to GOMOS/5.00, a new set of ADFs is in use, and the wavelength shifts are again within the threshold. This set of ADF was used also for the second reprocessing (2002-4th July 2006), so good wavelength characterization has been used for the second reprocessing.

Figure 5.3-1: Wavelength shifts on SPA2 since 12th November 2002 calculated using different stars

The values reported in the plot of fig. 5.3-1 are, for every star ID (1, 2, 9, 18, 25), the spectral shift on SPA2 CCD for which a maximum correlation has been found between the reference spectrum and the one of the occultation

During the last wavelength calibration analysis performed using some occultations of star id 1, 2 and 9 measured during August, the spectral shifts were again within the threshold.

5.4 Radiometric Performance

5.4.1 RADIOMETRIC SENSITIVITY

The monitoring performed consists of the calculation of the radiometric sensitivity of each CCD by computing the ratio between parts of the reference spectrum using specific stars (fig. 5.4-1). The parts of the spectrum used are:

UV: 250–300 nm
Yellow: 500–550 nm
Red: 640–690 nm
Ir1: 761-770 nm
Ir2: 935-944 nm

Figure 5.4-1: Radiometric sensitivity ratios since December 2002

For the spectrometers the ratios are with respect to the 'yellow' spectral range. For the photometers, the ratios are calculated by dividing the mean photometer signal above the atmosphere (115 km) by the 'yellow' spectral range (for PH1) or by the 'red' spectral range (for PH2).

The variation of the ratio should be within a given threshold which is set to 10% (see table 5.4-1 that corresponds to fig. 5.4-1). For every star, this variation is calculated as the difference between the maximum (or minimum) ratio, and the mean over the 15 first values (if there were not 15 values computed yet, all values would be used).

Ston Id	% Variation	% Variation	% Variation	% Variation	% Variation	% Variation
Star Iu	of UV ratio	of Red ratio	of IR1 ratio	of IR2 ratio	of Ph1 ratio	% Variation of Ph2 ratio
1	3.88836	0.775969	0.401701	0.250543	8.55029	30.1656
2	0.820376	0.990793	0.625175	0.383392	8.27717	7.93166
4	0.460608	1.30408	1.52463	1.30163	8.08780	23.5227
9	16.4250	1.35384	0.799394	0.603875	11.1437	9.05862
18	3.17715	1.41829	1.63441	1.76815	14.7885	299.989
25	29.2673	1.35252	1.85261	1.35782	28.0870	147.396

Table 5.4-1: Variation of RS for the different ratios (corresponds to fig. 5.4-1). Should be less than 10%

For star 9 and 25 the UV ratio is greater than the threshold 10%. It is clear (fig. 5.4-1) that there is a global decrease of UV ratios for all the stars. This confirms the expected degradation suffered by the UV optics that is, anyway, very small considering also the small variation for the rest of the stars (table 5.4-1).

By looking at the photometers radiometric sensitivity ratios of fig. 5.4-1, it can be seen that every star has a variation that seems to be annual. The variation is significant for stars 25 and 18. After some investigations performed by the QWG that exclude an inaccurate reflectivity correction LUT, it seems that the PH1/2 radiometric sensitivity variations could come from the fact that the spectrometers and the photometers are not illuminated the same way when the straylight appears (seasonal effect).

5.4.2 PIXEL RESPONSE NON UNIFORMITY

No new PRNU calibration has been performed during the reporting period. This means that the PRNU maps inside the ADF remain as they are without any change for the moment.

5.5 Other Calibration Results

Future reports will address other calibration results, when available.

6 LEVEL 2 PRODUCT QUALITY MONITORING

6.1 Processor Configuration

6.1.1 VERSION

Level 2 products from the operational ground segment have been disseminated during the reporting period to the users. About 89% of GOM_NL__2P products have been received by the DPQC team for routine quality control and long term trend monitoring. The current level 2-processor software version for the operational ground segment is GOMOS/5.00 since 8th August 2006 (see table 6.1-1). The product specification is PO-RS-MDA-GS2009_10_3I. Users are also supplied with 2002 - 4th July 2006 data sets reprocessed by the last prototype processor GOPR_6.0c_6.0f (developed and operated by ACRI) which is in line with the current GOMOS operational ground segment version GOMOS/5.00

Table 6.1-1: PDS level 2 product version and main modifications implemented

Date	Version	Description of changes
08-AUG-2006	Level 2 version 5.00 at PDHS-E and PDHS-K	 Algorithm baseline level 2 DPM 6.2: The optimisation of the DOAS iterations Negative column densities and local densities not flagged anymore Suppress the setting of maximum error in case of negative local densities Correction of HRTP discrepancies, and error estimates fixed Rename Turbulence MDS into High Resolution Temperature MDS (HRTP) Add vertical resolution per species in local densities MDS Add Solar zenith angle at tangent point and at satellite level in geolocation ADS Add "tangent point density from external model" in geolocation ADS
23-JUL-2006	Level 2 version 5.00 at FinCoPAC	 Suppress contribution of "tangent point density from external model" in "local air density from GOMOS atmospheric profile" in geolocation ADS Change in configuration at the time of the switch over: 2nd order polynomial for aerosol Air fixed to ECMWF (local density set to 0 in the L2 products) Orphal cross-sections for O₃ GOMOS cross-sections for other species Covariance matrix terms linked to air set to 0 Air and NO₂ additional errors set to 0
23-MAR-2003	Level 2 version 4.02 at PDHS-E and	Algorithm baseline level 2 DPM 5.5:

	PDHS-K	Section 3
	PDHS-K	 Add references to technical notes on Tikhonov regularization Change High level breakdown of modules: SMO/PFG Change parameter: NFS in 12 ADF Change parameter σ_G in 12 ADF (Table 3.4.1.1-II) Change content of Level 2/res products – GAP Change time sampling discretisation
		Add covariance matrix explanation
		 Section 5 Replace SMO by PFG VER-1/2: Depending on NFS, Apply either a Gaussian filter or a Tikhonov regularization to the vertical inversion matrix Unit conversion applied on kernel matrix Suppress VER-3
		Section 6
31-MAY-2003	Level 2 version 4.00 at PDHS-E and PDHS-K	 Algorithm baseline level 2 DPM 5.4: Revision of some default values Add a new parameter Transmission model computation: suppress tests on valid pixels and species Apply a Gaussian filter to the vertical inversion matrix Very low signal values are substituted by threshold value
21-NOV-2002	Level 2 version 3.61 at PDHS-E and PDHS-K	Algorithm baseline level 2 DPM 5.3a: Revision of some default values Wording of test T11 Dilution term computation of jend Covariance computation scaling applied before and after

Table 6.1-2: GOPR level 2 product version and main modifications implemented

Date	Version	Description of changes	
14-OCT-2005	GOPR_6.0f	 The optimisation of the DOAS iterations Negative column densities and local densities not flagged anymore Suppress the setting of maximum error in case of negative local densities Correction of HRTP discrepancies, and error estimates fixed Configuration for second reprocessing: 2nd order polynomial for aerosol Air fixed to ECMWF (local density set to 0 in the L2 products) 	

		 Orphal cross-sections for O₃ GOMOS cross-sections for other species Covariance matrix terms linked to air set to 0 Air and NO₂ additional errors set to 0
17-MAR-2004	GOPR 6.0a	 Rename Turbulence MDS into High Resolution Temperature MDS (HRTP) Add vertical resolution per species in local densities MDS Add Solar zenith angle at tangent point and at satellite level in geolocation ADS Add "tangent point density from external model" in geolocation ADS Suppress contribution of "tangent point density from external model" in "local air density from GOMOS atmospheric profile" in geolocation ADS
18-AUG-2003	GOPR 5.4d	Tikhonov regularisation is implemented
18-MAR-2003	GOPR 5.4b	 Modification to implement the computation of Tmodel for spectrometer B (in version 5.4b, the Tmodel for SPB is still set to 1)
30-JAN-2003 GOPR 5.4a • Modifications for ACRI products.		1 Wilder of the first the first as only 100 impact on level 2

6.1.2 AUXILIARY DATA FILES (ADF)

The ADF's files in table 6.1-3 and 6.1-4 are used by the PDS to process the data from level 1 to level 2. For every type of file, the validity runs from the start validity time until the start validity time of the following one, but if an ADF file has been disseminated after the start validity time, it is obvious that it will be used by the PDHS-E and PDHS-K PDS only after the dissemination time (this happens the majority of the time). Note that the files outlined in yellow are the set of auxiliary files used during the reporting period.

Table 6.1-3: Table of historic GOM_PR2_AX files used by PDS for level 2 products generation. The GOM_PR2_AX is a file containing the configuration parameters used for processing from level 1b to level 2 products

Used by PDS for Level 2 products generation in period	GOM_PR2_AX (GOMOS Processing level 2 configuration file)
01-MAR-2002 → 29-JUL-2002	GOM_PR2_AXVIEC20020121_165624_20020101_000000_20200101_000000 • Pre-launch configuration
30-JUL-2002 → 02-SEP-2002	 GOM_PR2_AXVIEC20020729_083851_20020301_000000_20100101_000000 Maximum value of chi2 before a warning flag is raised (set to 5) Maximum number of iterations for the main loop (set to 1)
03-SEP-2002 → 12-NOV-2003	GOM_PR2_AXVIEC20020902_151029_20020301_000000_20100101_000000 • Maximum value of chi2 before a warning flag is raised (set to 100)
13-NOV-2003 → 22-MAR-2004	GOM_PR2_AXVIEC20021112_170458_20020301_000000_20100101_000000 Smoothing mode Hanning filter Number of iterations Spectral windows to suppress the O2 absorption in the high spectral range of SPA2
23-MAR-2004 <u>Note</u> : this file was used by the GOMOS/4.02 processors before the IECF dissemination. The	GOM_PR2_AXVIEC20040316_145613_20020301_000000_20100101_000000 • Pressure at the top of the atmosphere • Number of GOMOS sources data (used in GAP)

dissemination was done on 25 th March 2004	 Activation flag for GOMOS sources data (GAP) Smoothing mode (after the spectral inversion) Atmosphere thickness
08-AUG-2006 Used at the time of switching over GOMOS/5.00	GOM_PR2_AXNIEC20051021_081111_20020301_000000_20100101_000000 Several level 2 processing configuration parameters

Table 6.1-4: Table of historic GOM_CRS_AX files used by PDS for level 2 products generation. The GOM_CRS_AX is a file containing the cross sections used for processing from level 1b to level 2 products

Used by PDS for Level 2 products generation in period	GOM_CRS_AX (GOMOS Cross Sections file)

30-JUL-2002 → 25-MAR-2004	GOM_CRS_AXVIEC20020729_082931_20020301_000000_20100101_000000 O3 cross-sections summary description (SPA) NO3 cross-sections summary description O2 transmissions summary description H2O transmissions summary description O3 cross sections (SPA)
26-MAR-2004 Note: the file was disseminated on 27 Jan 2004 but could not be used by PDS until version GOMOS/4.02 was in operation 08-AUG-2006 Used at the time of switching over	GOM_CRS_AXVIEC20040127_150241_20020301_000000_20100101_000000

6.1.3 RE-PROCESSING STATUS

The improvement of the GOMOS processing chain is a continuous on-going activity, not only for the processing algorithm but also for the instrument characterization data. In order to provide the best quality products to the users and due to the normal delay between algorithm specification and implementation in the operational PDS, it has been decided to reprocess the GOMOS data using the GOPR prototype.

The second reprocessing activity covering years 2002-2006 (until 4th July 2006) using the prototype GOPR_6.0c_6.0f is completed. All reprocessed data can be retrieved via web query from http://www.enviport.org/gomos/index.jsp. FTP access to bulk reprocessing results (one tar file of GOMOS products per day) is allowed from the D-PAC: ftp://gomo2usr@ftp-ops.de.envisat.esa.int. See more details and latest status on http://www.enviport.org/boards/board gomos.htm

6.2 Quality Flags Monitoring

In this section, some information contained in the Quality Summary data set of the level 2 products of August 2006 is shown (after 8th August 2006). In particular, the percentage of flagged points per profile for the local species O₃, H₂O, NO₂ and Air is depicted. Only products in dark limb illumination conditions and without fatal errors (error flag in the MPH set to "0") are used.

There are some difference in flagging strategy between new version GOMOS/5.00 and old version GOMOS/4.02. The strategy of the new version does NOT flag in red bullets conditions:

- The local density is less than a given minimum value
- The local density is greater than a given maximum value
- A negative local density was found
- The line density is not valid. And it occurs when:
 - o The acquisition from level 1b is not valid
 - o There is no acquisition used for reference star spectrum
 - o The line density is less than a given minimum value
 - o The line density is greater than a given maximum value
 - o A negative line density was found

Only for species: air, aerosol, O₃, NO₂, NO₃, OClO

- o No convergence after a given number of LMA iterations
- o χ^2 out of LMA is bigger than χ^2
- o Failure of inversion

Only for species: O2, H2O

- o Spectro B only: no convergence
- o Spectro B only: data not available
- o Spectro B only: covariance not available

There are points mainly between -80° and $+15^{\circ}$ latitude because in this period of the year full dark illumination condition occultations (only those products have been used for these plots) are geo-located on that region. In summer, full dark illumination data are mainly in the Southern Hemisphere while in winter it is the contrary: full dark illumination occultations are found mainly in the Northern Hemisphere.

Looking at fig. 6.2-1, the most evident characteristic that can be observed is the high percentage of flagged points per profile for some H₂O profiles. Users should be careful in using these data as the quality is only guaranteed for few stars. As a consequence of the new flagging strategy the percentage of flagged points per profile for O₃, NO₂ and Air is around 0%. It can be seen also that there are latitudinal bands with almost the same color (same percentages) mainly for H₂O. This means that the percentages of flagged points per profile have a dependence on the stars that have been observed: a given star is always observed at the same latitude but at different longitude.

Figure 6.2-1: Percentage of flagged points per profile

6.3 Other Level 2 Performance Issues

The plot presented in fig. 6.3-1 is the average of the Ozone values during August 2006 in a grid of 0.5 degrees in latitude per 1 km in altitude. Only occultations in dark limb have been used. Even though there is a reduction on latitude coverage due to the restricted azimuth field of view of the instrument, still some known characteristics can be seen:

- O_3 concentrations show a decrease with latitude near 40 km altitude. In the lower latitudes O_3 is generated by photolysis of O_2
- In the middle stratosphere (25-30 km) O₃ is strongly influenced by transport effects. Strong meridional and zonal transport is visible in middle and higher latitudes
- The lower stratosphere shows an O₃ increase with latitude. Highest values can be found within higher latitude regions due to downward transport of rich air masses

For this month some problems can be seen at -30/-40 degrees latitudes, probably related with the SAA zone.

Figure 6.3-1: Average GOMOS O₃ profile during the reporting month: average in a grid of 0.5° latitude x 1 km altitude

7 VALIDATION ACTIVITIES AND RESULTS

7.1 GOMOS-ECMWF Comparisons

7.1.1 TEMPERATURE AND OZONE COMPARISONS

Due to restrictions in the current METEO product format, filtering of METEO data is not possible. ECMWF results are therefore partially based on data that are not to be used for scientific application, as mentioned in the disclaimer (http://envisat.esa.int/dataproducts/availability/disclaimers)

7.1.1.1 July 2006

Find below the summary of ECMWF GOMOS monthly report for July 2006 data:

- The quality of GOMOS temperature and ozone data was found generally stable during July 2006, and comparable with that of June.
- Good agreement was found between GOMOS and ECMWF temperatures.
- GOMOS temperatures were lower than ECMWF temperatures in most of the stratosphere and mesosphere.

- The mean departures between GOMOS temperatures and ECMWF temperatures were less than -1% (about -2K) in all the stratosphere, up to 1hPa. Negative departures down to -2% (about -4K) were found, on global average, in the mesosphere.
- The global mean departures between GOMOS and ECMWF ozone profiles were still found very large, with +50% differences in places, especially in the upper stratosphere and mesosphere.
- Large scatter of GOMOS ozone data was found at all latitudes.
- Scatter plots showed unrealistically low GOMOS ozone values (0 DU) at most vertical levels.
- No water vapour data were available in NRT GOMOS BUFR files.
- The monitoring statistics for July were produced with the operational ECMWF model, CY30R1.

The full July 2006 ECMWF report can be found in the link below: http://earth.esa.int/pcs/envisat/tmp calval res/2006/ecmwf gomos monthly 200607 all.pdf

7.1.1.2 August 2006

Owing to technical problems followed the activation of the GOMOS Processor Version 5.00 on 8 August, the monitoring of GOMOS data was only possible until then.

Find below the summary of ECMWF GOMOS monthly report for August 2006 data:

- The quality of GOMOS temperature data was found generally stable during August 2006, and comparable with that of July. A deterioration of the quality of GOMOS ozone retrievals was found compared with July. This result, however, could more the consequence of the often very small dataset considered than a real worsening of the data quality.
- Good agreement was found between GOMOS and ECMWF temperatures.
- GOMOS temperatures were lower than ECMWF temperatures in most of the stratosphere and mesosphere.
- The mean departures between GOMOS temperatures and ECMWF temperatures were less than -1% (about -2K) in the entire stratosphere, up to 1hPa. Negative departures down to -2% (about -4K) were found, on global average, in the mesosphere.
- The global mean departures between GOMOS and ECMWF ozone profiles were still found very large, with +50% differences in places, especially in the upper stratosphere and mesosphere.
- Large scatter of GOMOS ozone data was found at all latitudes.
- Scatter plots showed unrealistically low GOMOS ozone values (0 DU) at most vertical levels.
- No water vapour data were available in NRT GOMOS BUFR files.
- The monitoring statistics for August were produced with the operational ECMWF model, CY30R1.

The full August 2006 ECMWF report can be found in the link below: http://earth.esa.int/pcs/envisat/tmp_calval_res/2006/ecmwf_gomos_monthly_200608_all.pdf

7.2 GOMOS-Climatology comparisons

Results are presented when available.

7.3 GOMOS Assimilation

Results are presented when available.

7.4 Consistency Verification: GOMOS-GOMOS Inter-comparison

Results are presented when available.

7.5 Inter-Comparison with external data

Results are presented when available.
