

MIPAS maps of mean distribution: 30-JAN-2012

Measurement Mode: Upper Atmosphere (42 - 172 km)

Processor version: MIPAS/5.06-N

Note to users

The following filtering criteria were applied: non convergent profiles or retrievals with chi-2 exceeding a predefined limit are removed from the maps.

The filtering criteria are explained in the Readme file for V5, available [here](#).

Statistics on filtered profiles for each target parameter are provided in the table below.

The retrieved geo-physical products are interpolated at different Teta levels.

The data is then interpolated to a fixed Lat/Lon grid using a weighted distance average.

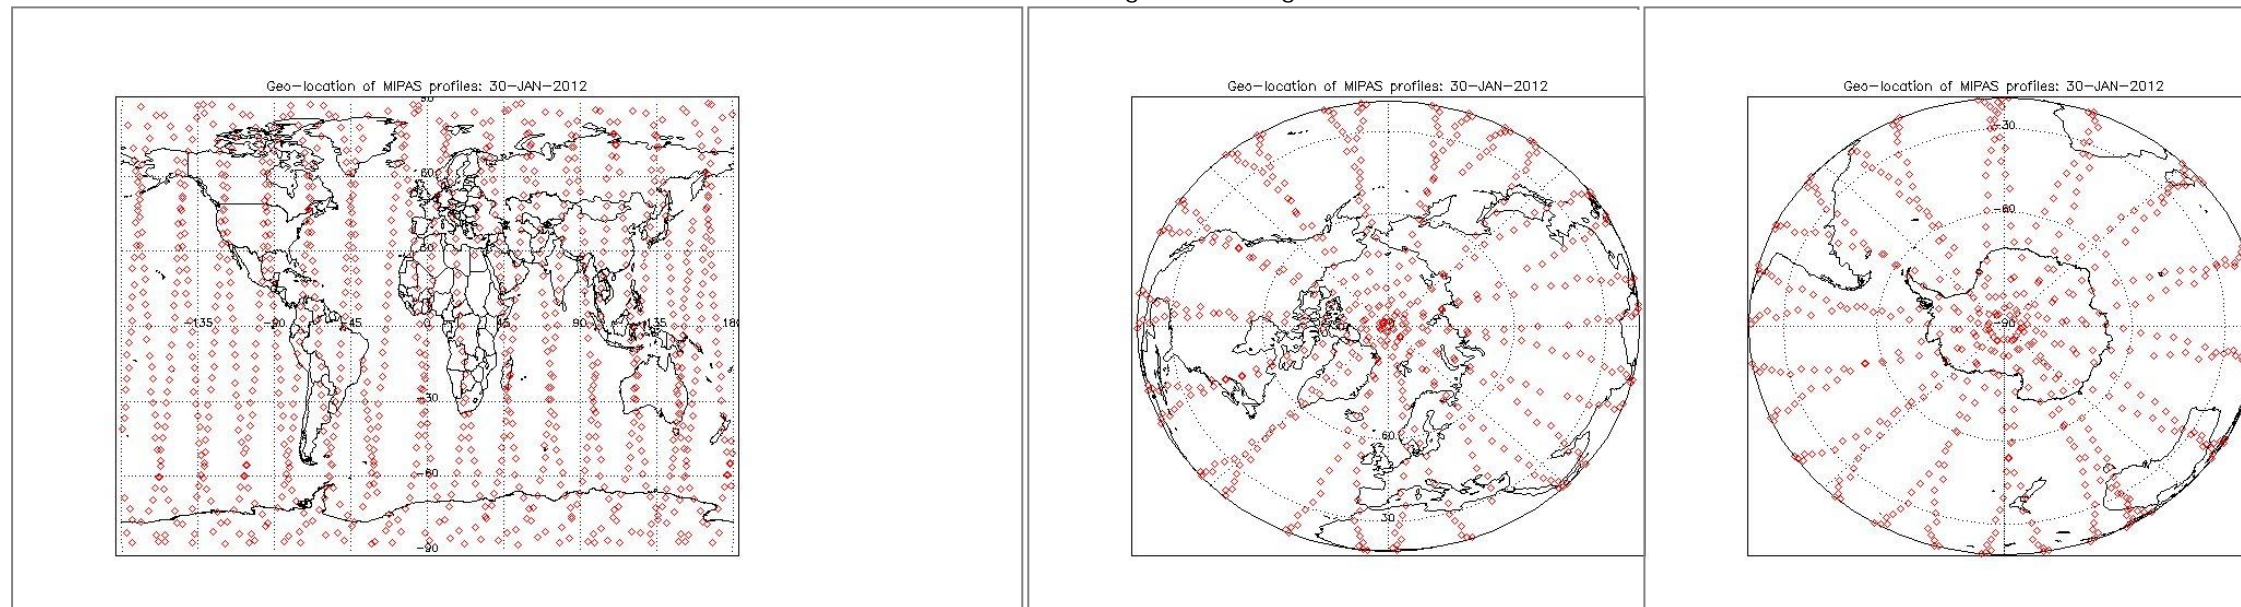

Note that Upper and Middle Atmosphere measurements are only retrieved up to 70km.

Total Number of profiles: 1062

Retrieved Parameter	Profiles not reaching convergence (%)	Profiles exceeding chi2 threshold (%)
p-T	0.28	1.98
H2O	0.38	0.19
O3	0.28	0.09
HNO3	95.01	0.09
CH4	0.38	0.09
N2O	1.41	0.09
NO2	0.85	29.00
