1 INTRODUCTION

The MIPAS Monthly Report (MR) documents the current status and recent changes to the MIPAS instrument, its data processing chain, and its data products.

The MR is composed of analysis results obtained by the DPQC (Data Processing and Quality Control), combined with inputs received from the different groups working on MIPAS operation, calibration, product validation and data quality. The following groups participate in the MIPAS Quality Working Group (QWG):

- ESRIN-DPQC
- ESOC
- ESTEC
- ABB BOMEM
- Oxford University
- IFAC-CNR
- EADS-Astrium GmbH
- Leicester University
- LISA
- IMK
- University of Bologna
- ISAC-CNR
- IAA
- DLR
- ECMWF

In addition, the group interfaces with the Atmospheric Chemistry Validation Team (ACVT).

1.1 Scope

The main objective of the MR is to give, on a regular basis, the status of MIPAS instrument performance, data acquisition, results of anomaly investigations, calibration activities and validation campaigns.

2 THE REPORT

2.1 Summary

- During December 2005, the MIPAS instrument was running very well, as observed in the last MR. Indeed the INT heater switch on during October 2005 improved significantly the performance of the slides and drastically reduced the number of unintended anomalies.
- For instrument safety, the MIPAS duty cycle is kept around a value of 25%, in particular following the recommendation of Astrium the instrument is working now with the following measurement scenario: 3 days-on / 4 days-off. This scenario allows a global coverage to be obtained in the three days of operations, while the four days switch-off of the instrument are important for relaxing the IDU system. This measurement scenario has shown to be safe and to minimize the number of critical turn-around failures.
- Owing to the warmer condition of the INT and to the low duty cycle of the instrument the unavailabilities during December 2005 operations were very few (4) when compared to the 39 anomalies detected during August 2005 operations, demonstrating the improvement of the instrument performance within this mission configuration.
- After switching-on the heater the Cooler performance shall be monitored with care. Indeed owing to the colder environment during December (decrease of INT temperature by 1K) the Cooler vibration levels remain stable around a value of 5mg.
- MIPAS operations during the first part of December 2005 (up to 17 Dec) were in UTLS-1 mode in support to the end of the SCOUT-O3 validation campaign.
- Special aircraft emission (AE) measurement were planned and acquired during 22-24 Dec operations.
- The IPF 4.65 validation activity was carried out during December 2005. This validation test showed a problem in one L2 ADF (v5.1). This bug was corrected by IFAC with a new delivery of L2 ADF (v5.2). With this new delivery the IPF 4.65 validation was resumed and the results will be reported in the next MR. According to the timeline provided by the ESF (who is in charge of the validation activity) this IPF will be put into operations at DPAC by the 1st of February 2005 and the OFL processing of MIPAS RR mission will then start.

2.2 Instrument and products availability

2.2.1 INSTRUMENT PLANNING

The planning for the MIPAS operations for December 2005 is described in this section.

- All activities planned in nominal mode (double slide operation) with medium resolution (41% 1.64 sec sweeps) with asymmetric transitory sweeps
- Radiometric Gain calibrations (RGC) planned using the MPL_ORS_MP file
- The WCC activity cannot be explicitly requested through the MPL_ORS_MP file, it is performed after every transition to Heater

- PRIME + 2 BACKUP LOS orbits during the week-end, with new setting and PITCH BIAS=-0.030<deg>
- MIPAS operations during 13-16 December were in UTLS-1 mode in support of the end of the SCOUT-O3 campaign.
- Middle Atmosphere and Upper Atmosphere measurement modes were planned for 29-31 December 2005
- Beside the background operations in Nominal mode several Aircraft Emission mode observations have been measured in 22-24 December

The files transferred to the FOCC for the planning of December 2005 operations are listed in Appendix A.

The measurements acquired during the Aircraft Emission campaign are listed in the following table.

Tab. 1 MIPAS AE measurement during 22-24 December 2005.

Mode	Orbit	Description
AE ascending orbit	19925-19928	19 across-track scans per
	19938-19942	orbit
	19952-19956	
AE descending orbit	19929-19932	19 across-track scans per
	19943-19947	orbit
	19957-19961	

2.2.2 INSTRUMENT AVAILABILITY

During December 2005 operations, MIPAS was affected by four unplanned unavailabilities due to IDU system errors. The MIPAS instrument unavailability intervals during December 2005 operations are listed below.

Tab. 2 List of MIPAS instrument unavailability in the period: December 2005.

Start time		Stop time		Duration	Start Orbit	Stop Orbit	Description
date	UTC	date	UTC	sec			
05-DEC-2005	23.23.38	06-DEC-2005	1.00.35	5817	19695	19695	MIPAS return to operation from Heater/Refuse mode due to IDU SYS TOL ERR
23-DEC-2005	23.23.10	24-DEC-2005	1.03.10	6000	19952	19953	MIPAS return to operation from Heater/Refuse mode due to IDU SYS TOL ERR
24-DEC-2005	12.47.44	24-DEC-2005	14.28.20	6036	19960	19961	MIPAS return to operation from Heater/Refuse mode due to IDU SYS TOL ERR
31-DEC-2005	18.24.35	31-DEC-2005	19.41.27	4612	20064	20064	MIPAS return to operation from Heater/Refuse mode due to IDU SYS TOL ERR

2.2.3 LEVEL 0 PRODUCT AVAILABILITY

Only Level 0 data coverage is reported below, as currently the Near-Real Time (NRT) mission is suspended, and no systematic operational Off-Line (OFL) processing is performed while the processing algorithms are being adapted to the new observation modes.

During the December 2005 there were 130 missing intervals during LOS measurements (MIP_LS__0P), these gaps were due to PDS unknown failures and are reported in the following table.

Tab. 4 List of missing intervals for MIP_LS__0P during December 2005.

2.2.4 LEVEL 0 PRODUCTS STATISTICS

The MIPAS mission is currently planned with a limited duty cycle (around 25%, corresponding to 3 days-on and 4 days-off), as recommended by Astrium for instrument safety. Nevertheless the availability of the L0 data for the planned time of measurement is high (more than 90%). Furthermore if we consider as a reference the time when the instrument is on (discarding instrument unavailability) the percentage of available L0 products is around 92%.

Tab. 5 MIPAS MIP_NL__0P products statistics during December 2005.

		Time [sec]
Total time over one month	t_{tot}	2678400
Time of planned measurements	$t_{ m plan}$	617346
Time of expected measurements	$t_{\rm exp}$	590337
Time of L0 inventoried	$t_{ m L0inv}$	589182
Time of L0 gaps	$t_{ m L0gaps}$	19408
Time of instrument unavailability	$t_{\rm unav} = t_{\rm plan} - t_{\rm exp}$	27009
%Time of duty cycle	$(t_{\rm plan}/t_{\rm tot})*100$	23,05 %
% Time of Instrument availability	$[1 - t_{unav} / t_{plan}] * 100$	95,62 %
% Time of L0 availability	$[(t_{exp} - t_{L0gaps})/t_{plan}]*100$	92,48 %

2.3 Instrument monitoring

2.3.1 THERMAL PERFORMANCE

The following two plots (Fig. 1 and Fig. 2) show the long-term trends of the IDU and MIO base plate temperature. The yearly seasonal variations and the interferometer heater switching (see Tab. 6 for the schedule of heater switch-on/off) are clearly visible within the plots.

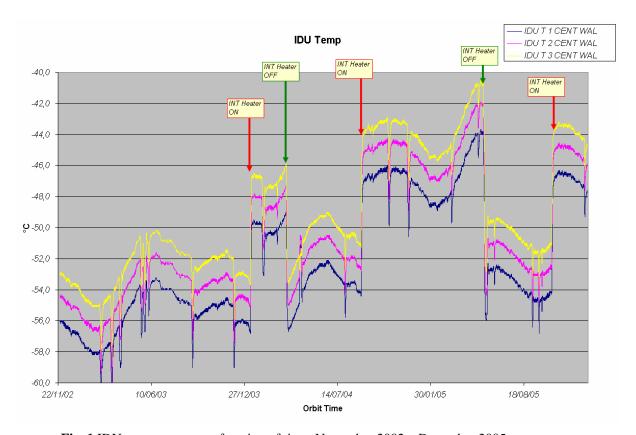

Fig. 1 IDU temperature as a function of time: November 2002 – December 2005.

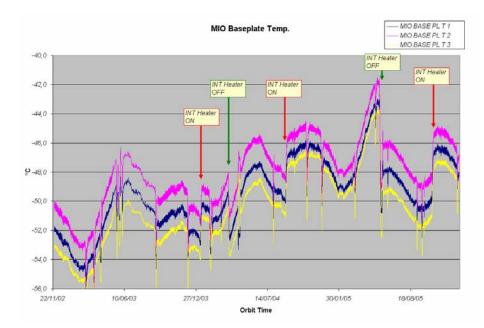

Fig. 2 MIO baseplate temperature as a function of time: November 2002 – December 2005.

The time of switch-on of the INT heater are reported in the following table.

Tab. 6 Schedule of interferometer heater switch-on/off.

Heater on	09-Jan-2004
Heater off	26-Mar-2004
Heater on	03-Sep-2004
Heater off	25-May-2005
Heater on	17-Oct-2005

At the end of August 2005, the temperature was about 4 K warmer than during the critical period at the beginning of 2003. However it seems that the critical temperature is increasing during the mission, nowadays we can consider the temperature of August 2005 (-52°C) as a critical value, that is to say a value when the occurrence of critical errors starts to increase. Furthermore an analysis made by Astrium revealed that the IDU performance improves when the INT-heater is switched-on. Indeed comparing the number of anomalies we had in 2005 operations with the INT heater switched-on wrt the INT heater-off we found:

- 36 INT errors during the time where the INT heater was ON (within 5.5 Month)
- 85 INT errors during the time where the INT heater was OFF (within 3.5 Month)

After this analysis, a decision was taken to switch-on the INT-heater again on 17th October 2005 during a planned unavailability of the instrument. The switching-on of the heater produce an increase of almost 5K of the MIO and IDU temperature, these temperatures reach values comparable to one year ago. The increase of temperature significantly improves the INT performances as will be discussed in the next paragraph.

During December 2005 operations the trend of IDU and MIO base plate temperature were stable with a decrease of temperature of about 1K, this is shown in the following plot.

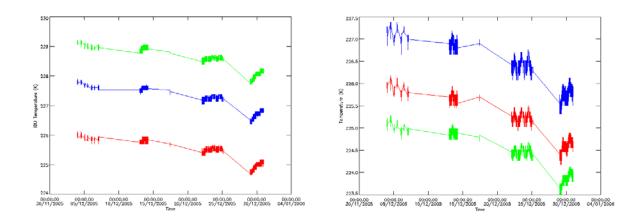

Fig. 3 IDU and MIO BasePlate temperature during reporting period: December 2005.

2.3.2 INTERFEROMETER PERFORMANCE

The high increase of IDU anomalies during August and the beginning of October 2005 led to the decision to switch-on the INT heater on 17-Oct 2005 in order to improve the slide performance. The effect of the INT heater switch-on was a significant improvement of the INT performances, in particular the number of critical turn-around error and the number of -4% differential speed error were drastically reduced as can be observed in the next figures. In particular Fig 4 shows that after the heater switch-on we didn't record any critical failure, on the contrary this was observed during end of August and beginning of October 2005 operations. In Fig. 4 we can see also that the -4% speed error after heater switch-on was reduced from a value of 70% to a more acceptable value of 40%. The dramatic reduction of anomalies in the last months is also due to the choice of a very low duty cycle, in particular the use of 3 days-on 4 days-off operations scenario.

During December 2005 operations this situation remains stable with a very limited number of IDU anomalies and no presence of critical error. The -4% differential speed error remains also to acceptable value of 40-50%, demonstrating that the INT heater on condition and the low duty cycle improved significantly the instrument performances.

Anomaly INT since 1.1.2005

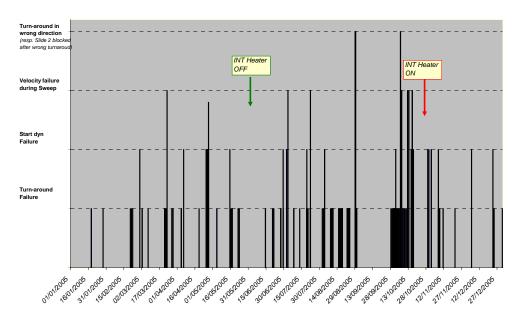

Fig. 4 MIPAS INT Anomaly during 2005 operations.

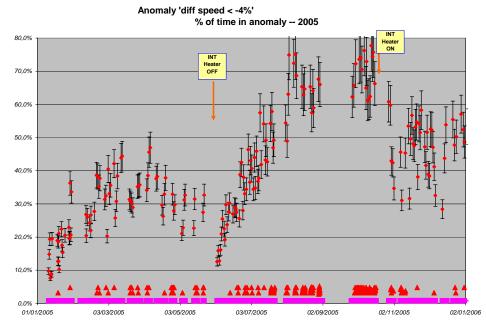

Fig. 5 MIPAS -4% differential speed errors during 2RR mission (from Aug 2004 to Nov 2005).

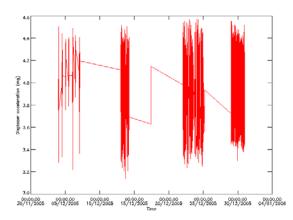

During the last IOP meeting it was also pointed out that the critical temperature is now raised to a value of about -53°C. Indeed when the instrument temperature fell below this temperature (during August 2005) the number of critical turnaround errors increased considerably.

In general, the instrument will perform even better with further increased temperature, for example by switching-on the second INT heater. This strategy can be interesting for future operations and it was proposed during the last IOP as a test scenario for future MIPAS measurements. Nevertheless when further increasing temperature the cooler performances should be monitored with care.

2.3.3 MECHANICAL PERFORMANCE

2.3.3.1 Cooler Performance

During March and April 2005 an evident increase in compressor vibration level has been observed, and starting from the second part of April 2005 the warning threshold of 8 mg has been exceeded many times. After an analysis done by Astrium, it has been found that the MIPAS cooler was not well balanced. The cooler rebalancing was performed from 11 May 07:39 to 12 May 12:14, during an interval of non-planned measurements. The rebalancing did not introduce the expected reduction of compressor vibration level because of the relatively warm environment. For this reason it was decided to switch-off the interferometer cooler on 25 May 2005. After the decontamination (23 May – 1 June 2005) and the Interferometer heater switch-off, the cooler performs extremely well. The performance of the cooler during the reporting period (December 2005) was nominal with vibration values well below our observation warning level of 8 mg, as can be seen in the following figures.

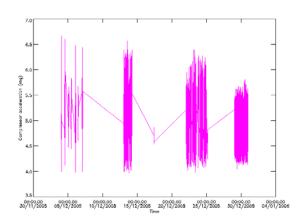

Fig. 6 December 2005: Cooler Displacer and Compressor vibration level.

The switching-on of the heater leads to increased effort from the cooler, with a slight increase of the compressor vibration level that reach maximum value of 7mg as observed during November 2005. Nevertheless the decrease of the INT temperature of about 1 K during December 2005 reduces the effort of the cooler. As can be seen from the following plots the compressor vibrations were reduced throughout December 2005. The presence of spike in the first days of the month (see Fig. 7), similar to what was observed during November, is reduced and at the end of the month the level of compressor vibration seems stable around a value of 5 mg.

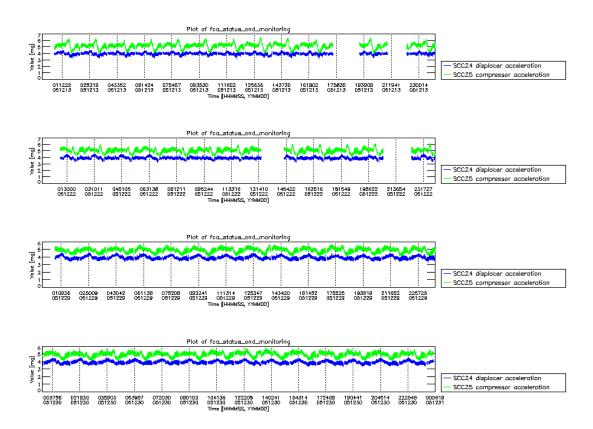

Fig. 7 Displacer and Compressor vibration level during four days of December 2005.

Level 1b product quality monitoring 2.4

2.4.1 PROCESSOR CONFIGURATION

2.4.1.1 Version

Tab. 7 shows the list of IPF updates and the aligned DPM/ADFs and the related NCR/SPRs. Currently the Near-Real Time (NRT) mission is suspended, and no systematic operational Off-Line (OFL) processing is performed while the processing algorithms are being adapted to the new observation modes.

Fig. 7 shows the alignment between the measurement mode (high resolution, reduced resolution with 17 sweeps and double-slide reduced resolution with 27 sweeps) and the corresponding valid IPF and ADF for the processing of both Level 1 and Level 2 products.

The validation of IPF 4.65 is underway and when completed this IPF will be put into operations at the DPAC for reprocessing of RR mission. The scheduled day when this IPF will be put into operations is fixed for the 2nd of February 2005.

Tab. 7 Historical updates of MIPAS processor and related DPM, ADF and NCR/SPR.

IPF	DF	PM	AI)F	Processor	update
Version	L1	L2	L1	L2	Level 1	Level 2
4.65	4I	4.1	4.1	5.1		Fixed NCR_1310

2.4.1.2 Auxiliary Data Files

The strategy for the level 1 ADFs update is as follows:

- The MIP_CO1_AX, MIP_CG1_AX and MIP_CS1_AX are updated every week and after a long detectors/cooler switch-off or after a long unavailability
- The MIP_CL1_AX is analysed every two weeks and updated when the pointing error differs with respect to the last disseminated by more than 8 mdeg.
- The MIP_PS1_AX is updated every time there is a setting update.
- The MIP_MW1_AX is updated when the micro-window is changed.
- The MIP_CA1_AX is updated when new characterization parameters are defined.

The ADF files generated and disseminated during December 2005 are listed in the following table.

Tab. 9 Level 1 ADFs valid in December 2005.

Tab. 10 Historical deliveries of level 1 ADF by Bomem

2.4.2 SPECTRAL PERFORMANCE

MIP PS1 AX

The calibration file MIP_CS1_AX contains the spectral correction factor (SCF), which compensates for variations in the instrument metrology e.g., aging of the laser. Fig. 7 gives the variation trend all over the 2RR mission (from August 2004). We observe a very stable situation since the variations are of the order of 2 ppm over more than one year of operations.

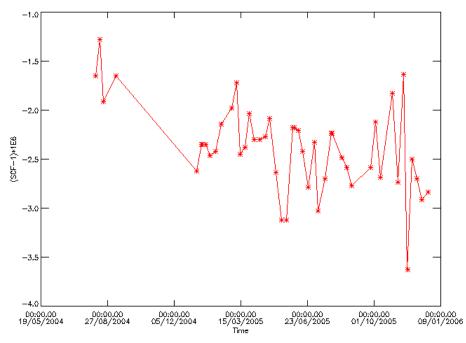

Fig. 9 MIPAS Spectral Calibration Factor (SCF) during RR ops updated to end of Nov 2005.

2.4.3 RADIOMETRIC PERFORMANCE

During December 2005 operations, the weekly increase of gain was always below the 1% warning threshold, as illustrated in Fig. 9. This figure shows the gain calibration check done weekly before disseminating an ADF. The check is done with respect to the last disseminated gain. In the case of a long mission interruption, the gain can change significantly; in this case the check is done the week later with respect to the first gain disseminated after the long interruption. The following figure shows that the check was always satisfied during the December 2005 interval, therefore the gain ADFs have been regularly disseminated.

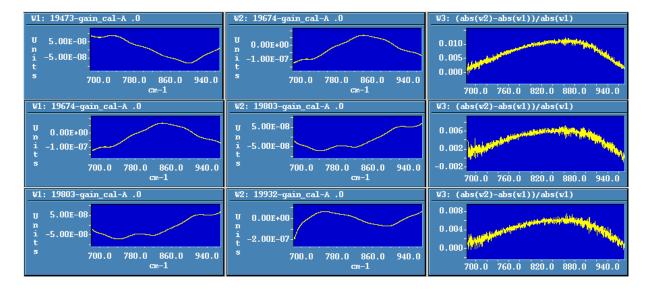

Fig. 10 Relative variations of radiometric gain for three disseminated gains (considering only band A) during December 2005 operations. The first two plots in each row are the imaginary gains plotted versus the wave-number, the third plot is the ratio: (abs(w2)-abs(w1))/abs(w1), which gives the gain increase wrt the reference w1 (last dissemiated ADF). The check is satisfied when the gain is lower than the warning threshold of 0.01 (1%).

Figure 11 shows the gain rate during 2005 operations, this rate is obtained as the maximum of the curves of weekly gain variation (abs(w2)-abs(w1))/abs(w1)) observed in Fig. 10. The very high increase of gain rate during Jan-May 2005 operations due to the presence of ice in the detectors can be seen. After the decontamination (end of May 2005) the gain rate suddenly decreases to nominal value (1%) and it remains stable all over the reporting period, up to the end of December 2005.

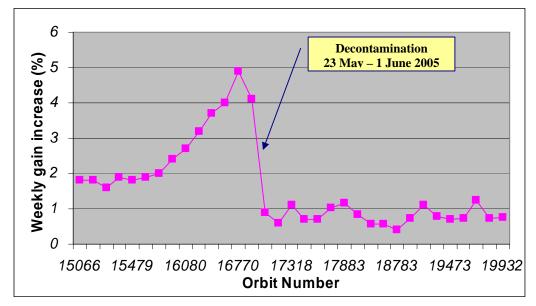

Fig. 11 Gain rate on a weekly basis during 2005 MIPAS operations updated to the end of Dec 2005.

2.4.3.1 Interpolated gains

During the period January-May 2005, a strong gain increase was observed in the weekly gain variation, as observed in Fig 9. This increase acts on the data quality in two ways:

- If the gain functions are only determined once per week, the drift leads to a scaling error in the calibrated spectra of up to 3.5 % in band A.
- The increase of the gain function corresponds to a decrease of the instrument response. This also decreases the signal-to-noise-ratio and leads to higher NESR-values.

The presence of ice near the detector was found to be the most probable source of this gain increase. Actually the ice reduces the radiation received by the detectors and this is the cause of the gain increase: the gain compensates for the lack of radiation.

Before processing 2005 level 0 data to level 1, a solution had to be found in order to reduce the scaling error in the calibrated spectra. The solution was to calculate and disseminate further gain values in between the already disseminated ones in order to comply with the condition for the gain increase to be lower than 1% between consecutive gains. This gain reprocessing has been done with the support of Bomem and the results are reported in *Appendix D*.

Due to missing L0 products to calculate all the gain calibration ADF files, a program was developed to estimate the missing gain calibration files using the gain calibration ADF files available (already disseminated via the IECF). The program simply performs a linear interpolation between 2 known gains. The second gain is first aligned on the same fringe as the 1st gain before doing the interpolation. The interpolation factor is specified such that there is less than 1% gain difference between 2 consecutive gains.

Gain I: Interpolated Gain vector 1st Gain Calibration vector G1: 2nd Gain Calibration vector G2:

Factor: Interpolation factor (0 < range < 1)

For the interpolated gain calibration files, the "SENSING_START" and "SENSING_STOP" fields are set according to the interpolation factors. For example, an interpolation factor of 0.33 applied to two existing gains (acquired 8 days apart), will fix the interpolated gain "SENSING_START" to 8 * 0.33 = 2.6 days later than the 1st gain "SENSING_START". The sensing stop is set to the end of the mission: "SENSING_STOP" = "SENSING_START" + 5 years.

The complete list of the new interpolated gains MIP CG1 AX files provided by Bomem and disseminated via IECF is reported in Appendix D. These 45 MIP_CG1_AX files should be used for the reprocessing of the 2005 2RR MIPAS mission.

2.4.4 POINTING PERFORMANCE

The LOS calibration measurements are performed every week and the mispointing is analysed on a bi-weekly basis. This plan allows the pointing stability to be analysed and guarantees the availability of the data in case of missing products. Initial analysis has shown a marked annual cycle (as shown in Fig. 10) covering the period September 2002 – June 2005. The figure shows the relative and the absolute pointing error (evaluated taking into account the commanded elevation angle for the LOS calibration). The annual trend is not due to the MIPAS instrument itself, but to a mispointing of the entire ENVISAT platform resulting from the software response to orbit control information. In fact, the update in the pointing software implemented on 12 December 2003 (orbit 9321) has reduced the deviation trend (see last points in Fig. 12).

During December 2005 operations, the LOS calibrations were performed twice and the results of the calibration are reported in the following table and figure. During the last 3 months of operations the relative bias seems to be stable around the value of 5-8 mdeg.

Tab. 11 LOS calibration performed on December 2005.

Date	Orbit #	Relative bias	Absolute bias
17-Dec-2005	19857	0,005385	-0,024615

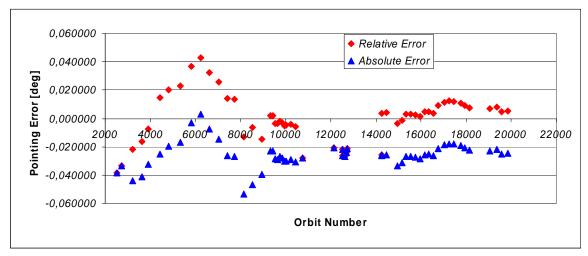

Fig. 12 MIPAS pointing error as a function of the orbit number: September 2002- December 2005.

As can be seen in Fig. 10, there are points where the relative and absolute errors coincide because the angle for LOS measurements has been commanded to 0 mdeg. Tab. 10 shows the history of the commanded angle for LOS measurements.

Tab. 12 LOS commanded angle updates.

Start Date	Start Orbit	Stop Date	Stop Orbit	Angle [mdeg]
beginning	/	28 Sep 2002	3024	0
05 Oct 2002	3123	26 Oct 2002	3424	- 22
02 Nov 2002	3524	30 Nov 2002	3926	- 25
07 Dec 2002	4025	01 Nov 2003	8738	- 40
08 Nov 2003	8835	08 Nov 2003	8836	- 25
10 Nov 2003	8864	10 Nov 2003	8865	0
15 Nov 2003	8934	6 Mar 2004	10538	- 25
13 Mar 2004	10639	20 Nov 2004	14250	0
21 Nov 2004	14265	/	/	- 30

Starting from the second part of September 2003, only measurements from channel D2 are processed because of the increased noise affecting channel D1. In order to reduce that noise, from 21 November 2004 (orbit 14265), the planning strategy for LOS measurements has been changed and the number of observations per star has been doubled.

During the anomaly investigation in winter 2004, the absence of interferometer operations was used for a dedicated Line of Sight campaign. MIPAS LOS data have been inter-compared with restituted attitude information from the ENVISAT star trackers, in preparation for future operational use of restituted attitude in off-line processing. Fig. 11 presents results from July 29th, 2004. Note that a bias of 24 mdeg was subtracted from the pointing error. Apart from this bias, results from the MIPAS LOS campaign agree with star tracker information. Investigations are currently ongoing to find the cause of this bias.

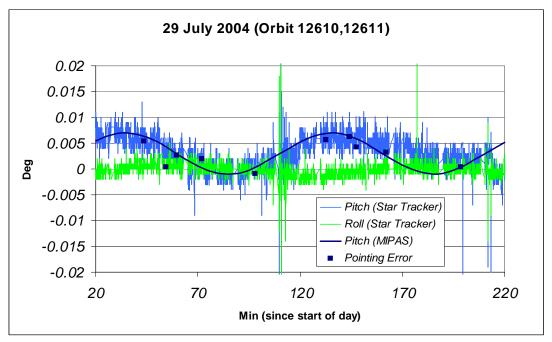

Fig. 13 Comparison between MIPAS pointing and star tracker information.

2.4.5 L1B PRODUCTS PROCESSED WITH PROTOTYPE

As noted before, no NRT product generation is foreseen for now. For the Science team and QWG, some Level 1B products have been generated using the migsp prototype. The complete list of these products is reported on *Appendix E*.

2.4.6 LEVEL 1 ANOMALY STATUS

The following table summarises the anomalies affecting Level 1 products and shows the associated SPR, NCR, AR and HD code.

Tab. 13 Level 1 anomaly list.

Anomaly	Prototype/DPM SPR	IPF NCR	OAR	HD
Number of sweeps	128	/	/	HD/01-2005/1010
per scan				
Truncated MIPAS	132	1421	1828	/
Gain measurements				
MIPAS Aircraft	/	/	1843	/
Emission				
measurements				

2.4.6.1 Number of Sweeps per Scan

The affected product is orbit 12963 generated with IPF 4.62. SPH gives:

"NUM SWEEPS PER SCAN=+00018", but 17 is the correct value (although the last scan has 18 sweeps).

The problem has been investigated by Bomem and it has been found that the auxiliary data block is missing in the last sweep of the orbit, so detection of the beginning/end of scan cannot be done. The prototype is not affected by the problem because Bomem has solved this particular problem by rejecting the last sweep when its auxiliary data block is missing. This specific case is not documented in the DPM and an SPR will be raised.

2.4.6.2 Truncated MIPAS Gain Measurements

Starting from June 2005, the DS (Deep-Space) and BB (Black-Body) sequence of measurements for MIPAS gain calibration is truncated at the end of a product and continues in the next one. The anomaly prevents automatic processing of gain measurements (with MICAL chain 06 algorithm) with a related delay to the generation and dissemination of Auxiliary Data Files (CS1_AX, CO1 AX, CG1 AX).

The investigation shows that in the planning the Kiruna/Artemis dump times were not taken into account, therefore some calibrations have been split into 2 different Level 0 files.

A workaround was found with the support of Bomem. This process consists of using one MIGSP special function, in order to "reconstruct" the calibration L0 file (by merging two products) and then using it as input to the processor, then finally getting the ADF calibration files.

Since the source and the solution of this problem have been found, this anomaly can be considered closed and the L0 calibration files affected by this problem have been successfully processed in order to get ADF calibration files.

2.4.6.3 MIPAS Aircraft Emission Measurements

Looking at the AE L1B file taken on 5/6 May 2005 (processed with MIGSP), the tangent altitudes seem to be approximately 2km below the 7-38 km range specified in Mission_Plan_V4.1.pdf dated 3 May 2005.

Bomem check these L1B products and the problem does not seem to be due to processing (MIGSP 2.5). The problem was found to be due to the commanding, in particular to the software (SEM mode algorithm) used for the AE measurements. The software was designed only for localized SEM measurements, such as volcano eruptions. The use of this algorithm over a wide area around the globe (such is the case of AE measurements) can lead to very important deviations owing to the earth ellipsoid. This is the cause of the deviation between the planned and measured tangent altitude for these AE measurements. In this sense this anomaly is closed, nevertheless Anu Dudhia reported at the last QWG a further anomaly affecting these products. This consists of a difference of almost 3 km between the retrieved and engineering altitude. This anomaly is not related to the planning and will need a different anomaly report and a deeper investigation in collaboration with Bomem and OU.

2.5 Level 2 product quality monitoring

2.5.1 PROCESSOR CONFIGURATION

2.5.1.1 *Version*

The list of IPF updates and the aligned DPM/ADFs and the related NCR/SPRs is listed in the paragraph 2.4.1. The historical updates in the MIPAS Level 2 processor are listed in detail in Appendix F.

2.5.1.2 Auxiliary Data Files

Tab. 15 shows the historical dissemination (from January 2003) of Level 2 ADFs until the mission interruption occurred in March 2004. In order to reprocess 2RR mission the latest version of level 2 ADF (version 5.1) was disseminated during November 2005.

The L2 ADF v5.1 was used for validation of the IPF 4.65 facility. This validation activity showed that there was a problem in one ADF file: MIP_SP2_AX (the file of the spectroscopy line list). This file is not used by the prototype or IPF, since the cross sections are calculated by means of look-uptable. Nevertheless the IPF is checking the consistency of this file, during this check the IPF found a problem in the binary part of the ADF, in fact this file doesn't contain the MICROWINDOWS ADS for N2O, HNO3, CH4, O3 and NO2. IFAC recognized that the problem was in the binary conversion of the file, while the ascii delivery it was correct. In the meantime a problem in the binary part of the MIP_IG2_AX v5.1 was discovered by IFAC.

Finally it was a SPR/SCR was open on L2 ADF and a new delivery of ADF (version 5.2) was provided by IFAC to ESRIN correcting for the bug in the ADF MIP_IG2, MIP_SP2. This delivery it was validated via IECF and is now in use for the validation of the IPF 4.65.

Further details on the Level 2 ADF deliveries provided by IFAC are reported in *Appendix G*.

2.5.2 RE-PROCESSING STATUS

Figure 14 shows the reprocessing status at the end of December 2005. The L0 expected field on the figure takes into account all instrument and product generation unavailability, so it describes what is actually expected. The discrepancy between expected and received is caused by a delay in the generation of consolidated Level 0 at LRAC.

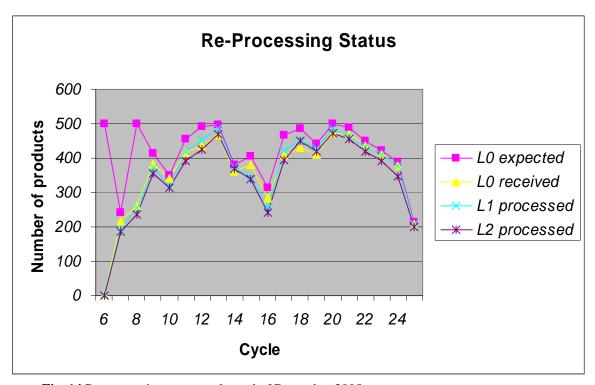

Fig. 14 Re-processing status at the end of December 2005

2.5.3 LEVEL 2 ANOMALY STATUS

The following table summarises the anomalies affecting Level 2 products and shows the associated SPR, NCR, AR and HD code.

Tab. 15 Level 2 anomaly list.

Anomaly	Prototype/DPM SPR	IPF NCR	OAR	HD
Anomalous processing time	33	1127	1361	/
Jump anomaly	/	/	/	HD/01- 2005/1013
Strange Impossible values	/	/	/	HD 2005003487
Excessive Chi-square	/	1458	1929	/
Difference on L2 products between v4.61 and v4.62		1521	2074	/
Beatcheck failure on some L2 products	/	1522	2081	HD 2005007448

2.5.3.1 Anomalous Processing Time

An anomalous processing time characterises the processing of some offline products generated with IPF 4.59. Two different anomalies have been observed:

- 9 hours of processing instead of nominal 6 hours. Example:
- MIP_NL__1POLRA20031006_005226_000060272020_00289_08359_1882.N1

MIP_NL__2PODPA20031006_005226_000060262020_00289_08359_0261.N1

- Processing failure after 24 hours of processing. Example:
- MIP NL 1POLRA20031024 012653 000060272021 00046 08617 0043.N1

For the first case, the anomaly is still under investigation. The second problem has been temporarily solved with a new MIP_OM2_AX that filter scans composed by only one vertical level (generating a loop that causes the processing to fail). For a definitive solution, the DMP will be changed (SPR 33) and the modifications will be implemented in next IPF delivery.

2.5.3.2 Jump Anomaly

Oxford University detected a jump in the zonal means of all Level 2 NRT data produced after switch-on on 8th February until 16th February 2004, compared with Level 2 data generated from 17th March 2004 but also with the data until switch-off on 9th February 2004. The anomaly is still under investigation, but aux data activation can already be excluded as the potential cause.

2.5.3.3 Strange Impossible values

When considering 6971 L2 product files (processed by the D-PAC with IPF 4.61 and 4.62) from all the mission (464546 profiles), Fricke found strange or impossible values in 231 profiles. "Impossible values" are negative variances in the corrected altitude, pressure, and temperature profiles. "Strange values" are geophysically strange values, such as pressure higher than 1.5 bar, pressure below 1 microbar, temperatures below 130 K or above 450 K, differences among LOS altitudes and corrected altitudes larger than 5 km. Since a detailed analysis of each of the 231 products is not feasible due to the operations deadline, a general explanation was supplied to the user.

- The presence of strange values in the retrieved product is not surprising. Actually we are retrieving some "information" (atmospheric profiles) from the MIPAS measurement (radiance spectra). In some cases, these spectra are not sensitive to the parameter to be retrieved for many reasons (e.g.: unflagged cloudy sweeps, corruption in the spectra, very low value of the parameter to be retrieved). In these cases, the uncertainty in the parameter is comparable to its value, therefore this parameter is undetermined: it can assume any value based around the uncertainty (negative, very small or very high).
- These strange values can also result from an instability in the retrieval due to the presence of cloudy or corrupted sweeps. In fact the p-T profile is retrieved all at once (from 6 to 68 km) and a corruption in one sweep can propagate to neighbouring sweeps (e.g.: an instability can occur just above a cloudy measurement).
- The presence of negative variance is not real, but it happens when the VCM matrix to be inverted is ill-conditioned (due to high correlation between parameters for example). In this case, the routine used to invert the matrix can give very strange results and in the diagonal you can find also negative values, which is due to the fact that the matrix to be inverted is close to being singular.

Note that the retrieval of p-T is performed at the same time and that the corrected altitudes are simply the engineering values corrected for the hydrostatic equilibrium using the retrieved p-T profile. Finally, a deeper analysis of the results shows that a strange value in the pressure or temperature results in errors in the corrected altitudes or that negative variances in the temperature often correspond to negative variances for pressure and for corrected altitude.

In conclusion in most of the cases these strange values are due only to instability in the (p+ T+ Zcorr) retrieval stage due to different reasons, some of them explained above. Nevertheless it will be important to isolate the most particular cases to see if there is any significant anomaly and it will be very important for the future to set up a strategy for masking unphysical results in the L2 products.

2.5.3.4 Excessive chi-square

NO2 MIPAS products for orbit #7000 (3 July 2003) came with high values of chi2, that were not reproduced in retrievals performed with the prototype using the same aux files set. This NCR 1458 it was classified as critical and is going to be analyzed by the IPF developers.

The first analysis by DJO shows that we actually facing to an implementation error, then a bug in the IPF. I found a bug in our code in the 'Compute Optimum Estimatre for Temperature/VMR' R 8.2.8.7-6. There was a wrong assignment of PS2 setting for Eo, po, grad E and Cr1 to the corresponding profile. After correction of this bug the IPF and prototype NO2 chi2 values for these orbit show to be the same. A patched version of the IPF will be delivered by DJO.

2.5.3.5 Difference on L2 products between v4.61 and v4.62

Some Level 2 products processed at DPAC with IPF 4.62 differ from the corresponding products processed with IPF 4.61, revealing a problem in the new 4.62 data. In particular the most significant discrepancies were detected for seq. # 16 of orbit 2975 (measured on 24 SEPT 2002) for T, N2O and CH4 profile at low altitude (around 140 hPa). This anomaly on 4.62 L2 products was not observed with the prototype (which is in accordance with 4.61 data). This OAR is now under investigation of IPF developers.

The following three plots show the tests made by IFAC on seq. no. 16 of orbit 2975 with Level 2 prototype using also the ECMWF file. In particular, we run Level 2 prototype using exactly the same input files as ESA Level 2 processor in the V4.62 case. This test confirms that the anomalous results in the ESA processor V4.62 cannot be reproduced by the prototype. In the following plots all results by IPF 4.62, IPF 4. 61 and L2 prototype with ECMWF are reported for T, N2O and CH4 profiles (the profiles for which the most significant discrepancies have been detected).

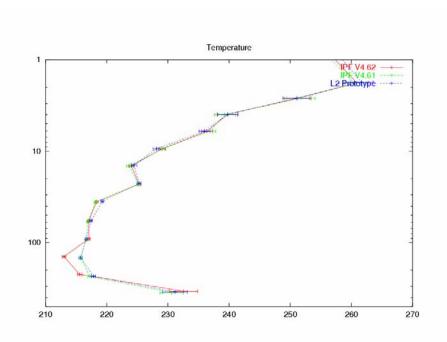

Fig. 15 Temperature profiles as a function of pressure retrieved with IPF 4.62 and 4.61 compared to the prototype for seq. 16 of orbit 2975.

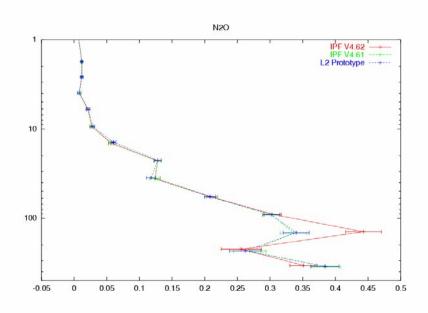

Fig. 15 N2O profiles 8ppmV) as a function of pressure retrieved with IPF 4.62 and 4.61 compared to the prototype for seq. 16 of orbit 2975.

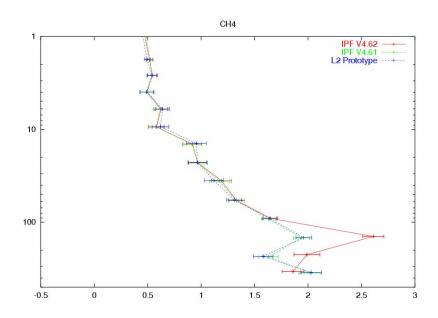

Fig. 16 CH4 profiles 8ppmV) as a function of pressure retrieved with IPF 4.62 and 4.61 compared to the prototype for seq. 16 of orbit 2975.

2.5.3.6 Beatcheck failure on some L2 products

Some L2 products processed at DPAC with IPF 4.61, 4.62 give beatcheck format error, as reported by the K.H. Fricke (HD 2005007448). The L2 products where this anomaly was found are the following:

MIP_NL__2PODPA20030702_064249_000059652017_00421_06988_2699.N1 MIP_NL__2PPDPA20030702_064249_000059652017_00421_06988_0369.N1 MIP_NL__2PPDPA20030827_065146_000060152019_00221_07790_0938.N1

The same products processed at DPAC with the IPF 4.62 give the same format error. The same L2 production made with the prototype didn't show this anomaly. The beatcheck output for these products is the following:

MIP_NL__2PODPA20030702_064249_000059652017_00421_06988_2699.N1

APPENDIX B LEVEL 1 IPF HISTORICAL UPDATES

The historical updates to the MIPAS Level 1 IPF processor are listed here:

- **Version V4.65** no update of Level 1 for this version
- **Version V4.64** (aligned with DPM 4I and ADFs V4.1) introduced modifications only for the Level 1 processor, with the following update:
 - Fixed internal SPR-12100-2011: Problem with the block sequence
- Version V4.63 (aligned with DPM 4I and ADFs V4.1) introduced modifications for both Level 1 and Level 2 processors. For the Level 1 processor, the following updates were introduced:
 - Processing of low resolution measurements, with reduced resolution also for offset and gain data.
 - Solution of internal SPR-120O0-2000: Band D oscillations in forward sweeps for MIPAS reduced-resolution products
 - Solution of internal SPR-12000-2001: NESR data problem
- Version V4.62 (aligned with DPM 4H and ADFs V4.0) introduced modifications for both Level 1 and Level 2 processors. For the Level 1 processor, the following updates were introduced:
 - Processing of low resolution measurements, without reduced resolution for offset and gain data that will be implemented in IPF 4.63.
 - Fixed NCR_1157: Bug in the MIPAS processor ILS retrieval.
 - Fixed NCR 1259: Scans with null NESR.
- **Version V4.61** consists of updates for both Level 1 and Level 2:
 - Fixed NCR_1143: Sparse corruption of bands between 1 and 4 January 2004.
- Version V4.59 has introduced only upgrade on Level 2 processor.
- **Version V4.57** involved only Level 1 processor update, introducing the following modifications:
 - Modification of FCE algorithm
 - Elimination of strong anomalous oscillations in the spectra
 - Modification of NESR reporting
 - ADC saturation flagging
 - Addition of aliasing spike suppression algorithm

APPENDIX C LEVEL 1 ADF HISTORICAL UPDATES

The Level 1 characterization files (MIP_CA1_AX, MIP_MW1_AX, MIP_PS1_AX) are provided by Bomem and updated when needed, the historic updates of these three ADF are listed hereafter.

Version 3.0

MIP_CA1_AX

- Modify non-linearity coefficients for reverse sweep. Coefficients for forward are kept as is
- Neutral equalization filter for band A

MIP_MW1_AX

- Removal of band D microwindow D_H20b at 1870.8049 cm-1
- Set spectral calibration microwindow altitude to 32 km

MIP_PS1_AX

- Number of co-additions for spectral calibration was set to 4
- Number of co-additions for ILS retrieval was set to 10

Version 3.1

MIP_PS1_AX

Changed the threshold to take into account the modified noise level

Version 3.2

MIP_PS1_AX

• Changed the threshold to take into account the modified noise level

Version 4.0 draft

MIP PS1 AX

- OPD set to 8.2 cm
- Channel A set to 4561 points
- Channel AB set to 2401 points
- Channel B set to 4561 points
- Channel C set to 2881 points
- Channel D set to 9441 points
- Number of co-additions for ILS retrieval was set to 5

Version 4.1 (TDS 6)

MIP PS1 AX

- OPD set to 8.2 cm
- Channel A set to 4561 points
- Channel AB set to 2401 points
- Channel B set to 4561 points
- Channel C set to 2881 points
- Channel D set to 9441 points

- Number of co-additions for ILS retrieval was set to 5
- Set standard deviation threshold to 5 for Scene measurement quality

Version 5.0 draft

MIP_PS1_AX

- OPD set to 10 cm
- Channel A set to 5701 points
- Channel AB set to 3001 points
- Channel B set to 5701 points
- Channel C set to 3601 points
- Channel D set to 11801 points
- Set standard deviation threshold to 5 for Scene measurement quality

Version 6.0

MIP PS1 AX

- OPD set to 20 cm
- Spike detection standard deviation threshold set to 10
- Spike detection number of points per block set to 256
- Set standard deviation threshold to 5 for Scene measurement quality

Version 6.1

MIP_PS1_AX

- OPD set to 8.2 cm
- Spike detection standard deviation threshold set to 10
- Spike detection number of points per block set to 256
- Set standard deviation threshold to 5 for Scene measurement quality

When one ADF is modified the three AUX file are disseminated with the same START/STOP time and this correspond to a new level 1 ADF delivery, this prevents confusion.

APPENDIX D INTERPOLATED GAINS

The following table lists the interpolated gain files generated by Bomem in order to solve the problem of the strong gain increase during Jan-May 2005 operations. The gain files already disseminated are highlighted in the table in green, while the newly generated gains are in orange.

ADF file name	Туре
	(* - interpolated gains)

5-6 May Aircraft Emission (AE) Measurements

Only 6 orbits have been processed, due to a processing problem we have one file for each measured scan. The following files have been delivered to the QWG team.

APPENDIX F LEVEL 2 IPF HISTORICAL UPDATES

The historical updates to the MIPAS Level 2 IPF processor are listed hereafter:

- **Version V4.65** (aligned with DPM 4.1 and ADFs V5.1, under validation) introduces modifications only for the Level 2 processor, with the following update:
 - Solution of NCR_1310: Problem with MIP_NL__2P
- **Version V4.64** no update for the Level 2 processor in this version
- **Version V4.63** (aligned with DPM 4.1 and ADFs V5.1) has introduced the following modifications:
 - Processing of reduced resolution measurements in old configuration (17 sweeps per scan and fixed altitude August/September 2004 measurements).
 - Solution of NCR_1278: Some MIPAS profiles have zero pressure
 - Solution of NCR_1308: MIPAS Level 2 failure.
 - Rejection of NCR_1310: Problem with MIPNL__2P
 - Rejection of NCR_1317: One second discrepancy in IPF 4.61
- Version V4.62 (aligned with DPM 4.0) has solved the following problems:
 - Fixed NCR 1128: Cloud-detection anomaly.
 - Fixed NCR 1275: Inconsistent values in MIPAS files.
 - Fixed NCR_1276: Level2 profile counting bug.
- **Version V4.60** has solved the following problems:
 - Fixed NCR_992: Inconsistency in number of profiles in MIPAS Level_2.
 - Fixed NCR_1068: Number of computed residual spectra not consistent with the number of observations.
- **Version V4.59**, operational since 23 July 2003, has introduced only Level 2 processing modifications. The main improvements introduced via both the processor V4.59 and the installation of a new set of ADFs have been:
 - Fixed NCR 892: Inconsistency in number of scans.
 - Fixed NCR 893: Different values for same scans.
 - The cloud filtering (that is, every time a cloud is detected at a given altitude, the retrieval is performed only above that altitude)
 - The removal of the gaps between the altitude validity ranges (allowing retrievals in the Antarctic region not feasible with the old MIP_MW2_AX)
 - Altitudes margins fixed to +/- 4 km
 - MIPAS-SPR-MAINT-0011 Wrong DSD name in L2 product in case of not requested VMR
 - MIPAS-SPR-MAINT-0012 Filling of SPH field 22 of MIPAS Level 2 ProductsMIPAS-SPR-MAINT-0013 Filling of the MIPAS MPH and MIPAS Level 2 SPH fields
 - MIPAS-SPR-MAINT-0014 Wrong writing of PCD String to the PCD Information ADS
 - MIPAS-SPR-MAINT-0015 Too strong test and skipping retrieval
 - MIPAS-SPR-MAINT-0016 Not initialised nucl1 and nucl2 in R 8.5.6.3-7A
 - ENVI-GSOP-EOAD-NC-03-0539 MIPAS L2 processing aborted

APPENDIX G LEVEL 2 ADF HISTORICAL UPDATES

The Level 2 ADF files historical deliveries by IFAC are reported in the following table and paragraph. Version 4 corresponds to a set of ADFs for processing of full resolution measurements, with the noise level adjusted for when the interferometer heaters are switched-on and a flag set for processing of only nominal measurements. Version 5 corresponds to ADFs for processing of reduced spectral resolution measurement (17 sweeps operations), so is able to process the measurements done in the Aug-Sept 2004 period.

Version	Date of	List of files upgraded by	Main modifications
	delivery	IFAC	
ADF	05.12.2005	MIP_SP2_AX_V5.2	Correct for a bug in the binary conversion of these two
V5.2		MIP_OM2_AX_V5.2_october	ADF. The ascii version of these files was correct then it
			was just a problem in the binary conversion of the
			ADF.
ADF	05.07.2005	MIP_MW2_AX_V5.1	Spectroscopic line list relative to the new microwindow
V5.1		MIP_SP2_AX_V5.1	database for reduced spectral resolution; PT error
		MIP_OM2_AX_V5.1	propagation matrices for nominal OMs added in file
			MIP_OM2_AX; upper limit of a microwindow for
			cloud detection changed.
ADF	18.03.2005	MIP_PS2_AX_V5	New microwindows selected for reduced spectral
V5.0		MIP_CS2_AX_V5	resolution, and corresponding cross section LUT,
		MIP_MW2_AX_V5	occupation matrices and Initial Guess for continuum
		MIP_PI2_AX_V5	(July and October seasons). Boundaries of the
		MIP_IG2_AX_V5_july	microwindows for cloud detection modified to match
		MIP_IG2_AX_V5_october	the new spectral grid at reduced resolution. New
		MIP_OM2_AX_V5	Pointing Information (PI) with a smaller error in LOS,
			new settings (PS) for handling reduced resolution
			measurements and optimised convergence criteria
			thresholds for reduced resolution mws.
ADF	03.09.2004	NRT:	Changed the flag in PS2 file spec_events_flag from
V4.1		MIP_PS2_AX_NRT_V4.1	"B" (dec 66) to "N" (dec 78).
		OFL:	NESR threshold in PS2 files as in V3.6.
		MIP_PS2_AX_OFL_V4.1	
ADF	03.09.2004	NRT:	Changed the flag in PS2 file spec_events_flag from
V4.0		MIP_PS2_AX_NRT_V4.0	"B" (dec 66) to "N" (dec 78).
		OFL:	Increased NESR threshold in PS2 files as in V3.7.
		MIP_PS2_AX_OFL_V4.0	

ADFs V5.2

Correct for a bug in the binary conversion of the following ADF: MIP_SP2_AX and MIP_IG2_AX files.

• ADFs V5.1

In this latest release of the ADFs, the spectroscopic line list relative to the new microwindow database for reduced spectral resolution was updated. Also, the PT error propagation matrices

for nominal OMs (file MIP_OM2_AX) and the upper limit of a microwindow for cloud detection were changed.

• ADFs V5.0

ADFs for processing of double-slide reduced resolution measurements in the old configuration (17 sweeps per scan, fixed altitude – August/September 2004 data). Those ADFs contain new settings (convergence criteria, NESR threshold in MIP_PS2_AX) and new MWs (MIP_MW2_AX) and OMs (MIP_OM2_AX) optimised for the reduced resolution mode. They also contain a new MIP_PI2_AX updated taking into account the results of an investigation done by Bologna University on LOS. In fact, a new definition of the pointing covariance data was performed according to the available pointing characterization measurements. In particular, the errors on tangent altitude increments obtained from the analysis of LOS-specific measurements were found to be smaller (87 m versus 120 m) than those derived using an empirical model based on the pointing specifications. Tests on Level 2 p, T retrievals confirmed that a LOS pointing error of about 80 m provides a constraint for p, T retrieval that is perfectly compliant with the observed limb radiances. Eighty metres is a reasonably conservative estimate of the error on tangent altitude increments that can be used in the PDS for operational MIPAS retrievals. Reduction of the LOS error from 120 to 80 m leads to a reduction of both p and T errors. Namely, on average, p error turns-out to be reduced from 1.27 to 1.1 % and T error turns-out to be reduced from 1.1 to 1.0 K. The delivered auxiliary data file containing LOS VCM data (MIP_PI2_AX) can be used in Level 2 to process both high and low resolution measurements acquired either in the new or in the old measurement scenario.

• ADFs V4.1

ADFs for processing of full resolution measurements, with MIP_PS2_AX file with noise level adjusted to interferometer heaters switched-off and flag set for processing of only nominal measurements.

• ADFs V4.0

ADFs for processing of full resolution measurements, with MIP_PS2_AX file with noise level adjusted to interferometer heaters switched-on and flag set for processing of only nominal measurements.
