# **SCIAMACHY BI-MONTHLY REPORT SEPTEMBER - OCTOBER 2006**

## **1 INTRODUCTION**

The SCIAMACHY Bi-Monthly report documents the current status and recent changes to the SCIAMACHY instrument, its data processing chain, and its data products.

The Bi-Monthly Report (hereafter BMR) is composed of analysis results obtained by the DPQC, combined with inputs received from the different groups working on SCIAMACHY operation, calibration, product validation and data quality.

The first part of the report is dedicated to Instrument Configuration and Performance. It is composed of contributions from SOST-DLR and SOST-IFE.

The remainder of the report is dedicated to level 1 and level 2 performance assessment and is generated by ESA/ESRIN DPQC with contributions from ESA/ESTEC PLSO and DLR-IMF.

The structure of the report will be in constant evolution through the ENVISAT mission, as experience with SCIAMACHY data and quality control grows.

### **1.1 Scope**

The main objective of the BMR is to give, on a regular basis, the status of SCIAMACHY instrument performance, data acquisition, results of anomaly investigations, calibration activities and validation campaigns. The BMR is composed of the following six sections:

- Summary;
- Instrument Configuration and Performance;
- Data Availability Statistics;
- Level 1 Product Quality Monitoring;
- Level 2 Product Quality Monitoring;
- Validation Activities and Results.

TC	Thermal Control
TCFoV	Total Clear Field of View
TOA	Top of Atmosphere
TRUE	Tangent height Retrieval by UV-B Exploitation
VCD	Vertical Column Density
WLS	White Light Source

## 2 SUMMARY

- During the reported period SCIAMACHY measurements were nominal with respect to planning, except for one anomaly and a planned OCM
  - 23641-23698 (07-11 September 2006)                      AOCS anomaly
  - 23717-23725 (13 September 2006)                      OCM
  
- An anomaly of the Antenna Pointing Controller caused the loss of following Orbits:
  - 23916-23921,
  - 23930-23935,
  - 23944-23949,                      (26 September – 01 October 2006)
  - 23959-23963,
  - 23973-23978
  
- Monthly Calibration was executed during Orbits:
  - 23628-23632 (06/07 Sep 2006)
  - 24043-24047 (05/06-Oct-2006)
  
- The moon was in the limb TCFoV between orbits
  - 23575-23655 (03-Sep-2006 until 08-Sep-2006)
  - 23994-24076 (02-Oct-2006 until 08-Oct-2006) and 24415-24419 (31-Oct-2006):
  
- Four OCRs were implemented:
  - OCR\_025 (Extended moon observations)
  - OCR\_026 (Increase number of subsolar pointing measurements)
  - OCR\_027 (Reduction of subsolar rate)
  - OCR\_028 (Improve limb and nadir coverage for Cabauw Dandelions-2 campaign)
  
- No TC adjustment was executed.
  
- Light Path monitoring:
  - Channel 1&2: degradation in UV for all light paths involving ESM increases with a rate of 0.5-1 % per month. The average throughput loss in channel 1 is currently ca 26%.
  - Channels 3 small throughput loss (about 2%)

esa

DLR

ife

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 9 of 58

- Channel 4 small throughput loss continues
  - Channel 5 throughput shows a slight decrease in this reporting period
  - Channel 6 throughput remains stable at ca. 98%
  - Channel 7 throughput shows a decrease of ca. 0.5%
  - Channel 8 throughput remains stable at about 75%
- PMD monitoring:
    - UV degradation visible in science channels is also visible in PMD 1 to 3
    - PMD 4 and 7 show a large decrease in throughput which is currently unexplained. (possible explanation: specific detector material)
    - PMD 6 results still under investigation
- The preliminary validation meeting was held at KNMI, Utrecht 20<sup>th</sup> September 2006.
  - An extension of the validation data set, containing full orbits and days, was processed and uploaded to the D-PAC server.

### 3 INSTRUMENT CONFIGURATION AND PERFORMANCE

#### 3.1 In-Flight Status and Performance

Detailed operations, planning and instrument status information can be found on the website of the *SCIAMACHY Operations Support (SOST)* under <http://atmos.caf.dlr.de/projects/scops/>. These pages are maintained on a daily basis and show the history and actual progress of the SCIAMACHY mission.

##### 3.1.1 Planned Operations and Measurements (SOST-DLR)

The reporting period covers the orbits 23546 (ANX = 01-Sep-2006, 00:05:57.256) to 24419 (ANX = 31-Oct-2006, 23:48:42.525). Two OSDFs specified the planning baseline.

Orbit		ANX		OSDF
Start	Stop	Start	Stop	
23546	23975	01-Sep-2006 00:05:57.256	30-Sep-2006 23:22:50.429	MPL_OSD_SHVSH_20060706_010101_00000000_33200001_20060901_000559_20061001_010324
23976	24419	01-Oct-2006 01:03:26.358	31-Oct-2006 23:48:42.525	MPL_OSD_SHVSH_20060720_010101_00000000_34010001_20061001_010328_20061101_012916

Table 3-1: SCIAMACHY OSDF planning file from September – October 2006

All measurements were nominal, i.e. timelines executed on the dayside of the orbit limb/nadir sequences with wide swath settings except for lunar observations which had to reflect OCR\_025 (see below). In-flight calibration and monitoring measurements occurred on daily, weekly and monthly timescales according to the mission scenarios. Monthly calibration was scheduled between orbits

- 23628-23632 (06/07-Sep-2006)
- 24043-24047 (05/06-Oct-2006)

The moon was in the limb TCFoV between orbits

- 23575-23655 (03-Sep-2006 until 08-Sep-2006)
- 23994-24076 (02-Oct-2006 until 08-Oct-2006) and 24415-24419 (31-Oct-2006)

No occultations with the moon rising on the nightside could be executed.

Four OCRs had to be implemented. These were

- OCR\_025 (Extended moon observations): Nominal scanning measurements of the moon starting close to the top of the atmosphere and ending when the moon leaves the limb TCFoV were scheduled for the complete September and October monthly lunar visibility periods.

esa

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 11 of 58

- OCR\_026 (Increase number of subsolar pointing measurements): This change became effective with 01-Oct-2006, orbit 23978 when the new timeline set required by OCR\_027 was implemented.
- OCR\_027 (Reduction of subsolar rate): Due to the need to reduce the activations of the NCWM LLI to cope with an extended mission, a new timeline set was generated and uploaded. It became effective with 01-Oct-2006, orbit 23978.
- OCR\_028 (Improve limb and nadir coverage for Cabauw Dandelions-2 campaign): The Cabauw coverage was improved by exchanging limb/nadir sequence 1 or 2 timelines in the planning process, whenever appropriate.

### 3.1.2 Instrument Measurement Status (SOST-DLR)

On 01-Oct-2006 in orbit 23978 the final flight status for timelines changed with the upload of timeline set 34 replacing timeline set 33. Timeline set 34 implemented OCR\_026 (see above).

### 3.1.3 Executed Operations and Measurements (SOST-DLR)

#### Measurements

The OSDF planning file has been scheduled as requested except for two periods in September when MPS driven operations stopped due to an ENVISAT AOCS anomaly (07-Sep-2006, orbit 23641 to 11-Sep-2006, orbit 23698) and a planned OCM (13-Sep-2006, orbit 23717-23725).

#### Detector thermal adjustment

No TC adjustment was executed. Thus the TC settings remained unchanged at

- DAC1 = 0.53 W
- DAC2 = 0.70 W
- DAC3 = 0.00 W

#### APSM/NDFM health checks & PMD ADC cal

In the reporting period 2 APSM/NDFM health check and 2 PMD ADC calibrations were executed. All showed nominal results.

APSM/NDFM			PMD ADC	
Orbit	ANX	Result	Orbit	ANX
23907	26-Sep-2006 06:50:14	ok	23908	26-Sep-2006 08:26:44
24408	31-Oct-2006 06:54:19	ok	24409	31-Oct-2006 08:30:49

Table 3-2: APSM/NDFM health check and PMD ADC calibration

esa

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 12 of 58

### Anomalies

One major on-board anomaly had occurred. In orbit 23641 (07-Sep-2006, 15:42:50 UTC) an AOCS anomaly occurred on ENVISAT level triggering a switch-off of the payload. MPS driven operations resumed in orbit 23698 (11-Sep-2006).

Orbit	Date	Entry - UTC	Level	Entry Type	ID Content/Transition	Mode	Remark
23641	07-Sep-2006	2006_250_16_40_30.000	ENVISAT	SWITCHING	AOCS anomaly	OFF-SAFE	ENVISAT payload switch-off

Table 3-3: Instrument anomalies between September and October 2006

In addition between orbits 23916-23978 (26-Sep-2006 and 01-Oct-2006) the Antenna Pointing Controller (APC) showed non-nominal behaviour and was switched-off accordingly. This caused the loss of data downlinks via Ka-band. The affected orbits are 23916-23921, 23930-23935, 23944-23949, 23959-23963 and 23973-23978. Due to the ongoing failure investigation the Ka-band link remained non-operational until end of October. In order to re-establish full coverage the Svalbard-Kiruna scenario was implemented for the time being.

### Instrument unavailability

The instrument was unavailable during the ENVISAT AOCS anomaly and a planned OCM (see above).

Fig. 3-1: Current instrument availability status including the reporting period

## 3.1.4 Performance Monitoring - System (SOST-DLR)

### Detector temperatures

Detector temperatures are monitored according to the requirements of the IOM [1]. It requests to ensure that the average temperature per orbit remains within the specified limits. For each detector the average temperatures per orbit are determined from HK telemetry parameters. Fig. 3-2 displays the temperatures of all 8 detectors. Colour coding is as on the operational monitoring website, i.e. data from orbits with HK telemetry coverage > 90% are shown in red, for < 90% in green. Minimum/maximum values per orbit are indicated as vertical bars. The temperature limits of each detector are shown as horizontal lines.

esa

DLR

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 13 of 58

Detector temperatures remained within limits.

### ***OBM temperatures***

OBM temperatures are monitored according to the requirements of the IOM [1]. It requests to ensure that the average temperature per orbit remains within the specified limits. The average OBM temperature per orbit is determined from specific HK telemetry parameters. In addition power readings for the ATC heaters are monitored. Temperatures and ATC heater powers are given in Fig. 3-3 and 3-4. Colour coding is as in Fig. 3-2.

OBM temperatures and ATC heater powers remained within limits.

### ***PMD ADC status***

The status of the PMD ADC is monitored according to the requirements of the IOM [1]. It requests to ensure that no glitches occur caused by an SEU.

No PMD ADC glitches have been detected.

### *LLI status*

Life Limited Items are monitored based on analysis of the

- OSDF: This yields a predicted LLI usage.
- Report format: This counts the actual LLI switches or used LLI cycles. No WLS/SLS burning times can be derived thereof.

In addition, the in-flight usage of the cryogenic heat pipe is recorded. This subsystem has a limited number of cycles. Each decontamination increases the accumulated number of cycles by 1.

At the end of the reporting period the fractional usage of the LLI relative to the allowed in-flight budget was

- NDFM: 0.64
- APSM: 0.58
- NCWM (sub-solar port): 0.67
- WLS (switches): 0.12
- WLS (burning time): 0.23
- SLS (switches): 0.04
- SLS (burning time): 0.01

How the relative LLI usage has accumulated since launch can be seen in fig. 3-5. 'EOL' assumes a total mission lifetime of 0.5 years of Commissioning Phase and 4.5 years of routine operations.

Note: In order to prepare for the ENVISAT/SCIAMACHY mission extension it was decided to modify the mission scenarios slightly by reconsidering the usage of the most critical LLIs, i.e. NCWM, APSM and NDFM. As a result, sub-solar measurements will be executed only 2/week. Solar occultations remain at a rate of 1/orbit because it was found acceptable to exceed the currently specified in-flight budgets (based on a safety margin factor of 2) as long as the usage stays below the figures of the lifestests. However it will even take until April 2009 (NDFM) and November 2009 (APSM) that the in-flight budgets are exceeded. The envisaged reduction in sub-solar measurements was implemented via OCR\_027 in October (see chapter 3.1.1).

esa

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 18 of 58

Fig. 3-5: Relative usage of LLIs. 'EOL' is derived for a mission lifetime of 5 years (not yet taking mission extension and modified subsolar measurements into account). Note the change in slope for the NCWM due to the reduction of subsolar measurements starting in October 2006.

The number of cryogenic heatpipe cycles did not increase (no decontamination). The budget used remained at 38% of the allowed in-flight budget.

### Time reference

The times quoted in all planning files refer to the reference orbit. Since the actual orbit differs from the reference orbit (e.g. orbit drift), the times given w.r.t. the reference orbit also do not reflect exactly the actual absolute times of events along the orbit (e.g. ANX, sunrise, sub-solar, moonrise, eclipse). The requirements for orbit maintenance may result in time differences of usually  $< \pm 10$  sec. In some cases this value may even reach  $\pm 1$  min, however.

SOST monitors how the reference time deviates from the actual time. This is done by using the predicted time which comes very close to the actual = restituted time. If the predicted times are delayed w.r.t. the reference orbit, then the difference *predicted - reference time* is  $> 0$  sec; in the other case it is  $< 0$  sec.

Fig. 3-6 displays the time difference *predicted - reference*. Orbit manoeuvres cause distinct discontinuities.

esa

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 19 of 58

Fig. 3-6: Time difference between predicted and reference time.

### 3.1.5 Performance Monitoring - Light Path (SOST-IFE)

#### 3.1.5.1 Science Channel Averages

One part of the SOST long-term monitoring activities is the trend analysis of measurements with the internal White Light Source (WLS) and of observations of the unobscured Sun above the atmosphere. In order to monitor the different SCIAMACHY light paths solar measurements are taken in various viewing geometries: In limb/occultation geometry (via ASM and ESM mirrors), in nadir geometry (via the ESM mirror through the subsolar port), and via the so-called calibration light path involving the ASM mirror and the ESM diffuser.

SCIAMACHY long-term monitoring comprises a regular analysis of these measurements.

The plots displayed in Fig. 3.7 show results of these monitoring activities for the time interval September to October 2006.

All measured signals have been averaged over the entire channel and then divided by the corresponding measurement at a reference time (currently 2 August 2002, at about orbit 2200), yielding an effective instrument throughput for the different light paths.

The timing of subsolar measurements before 30 November 2002 (about orbit 3922) did not consider the known yaw misalignment of SCIAMACHY on ENVISAT. Therefore all subsolar measurements after 30 November 2002 have been referred to orbit 4519 (10 March 2003, just after a long decontamination phase).

esa

DLR

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 20 of 58

Note that measurements performed during times of reduced instrument performance (e.g. switch-offs or decontamination periods) have been omitted.

The results presented in Fig. 3.7 are based on the analysis of Level 0 data, which have been corrected for dead/bad pixels, dark current (fixed value from August 2002), scan angle dependencies, quantum efficiency changes, and the seasonally varying distance to the Sun. Additional calibration steps have not been performed, like for example a straylight correction. Therefore, variations smaller than about 1% require careful interpretation. Especially, small variations of the throughput signal may be caused by remaining seasonal effects due to the limited calibration of the data.

Furthermore, there exists a systematic offset between the throughput results for the subsolar light path and those for the other viewing geometries. This offset is most prominent in the IR and caused by the specific subsolar scan mode (fast sweep) analysed in combination with the averaging method (arithmetic mean over all pixels).

Until October 2006 the nadir/subsolar light path was monitored based mainly on fast sweep measurements. However, subsolar pointing measurements are considered to have a better quality for monitoring purposes (especially for PMD monitoring) and thus have become the new baseline.

esa

serco

SCIAMACHY BI-MONTHLY

issue 1 revision 1 -

page 21 of 58

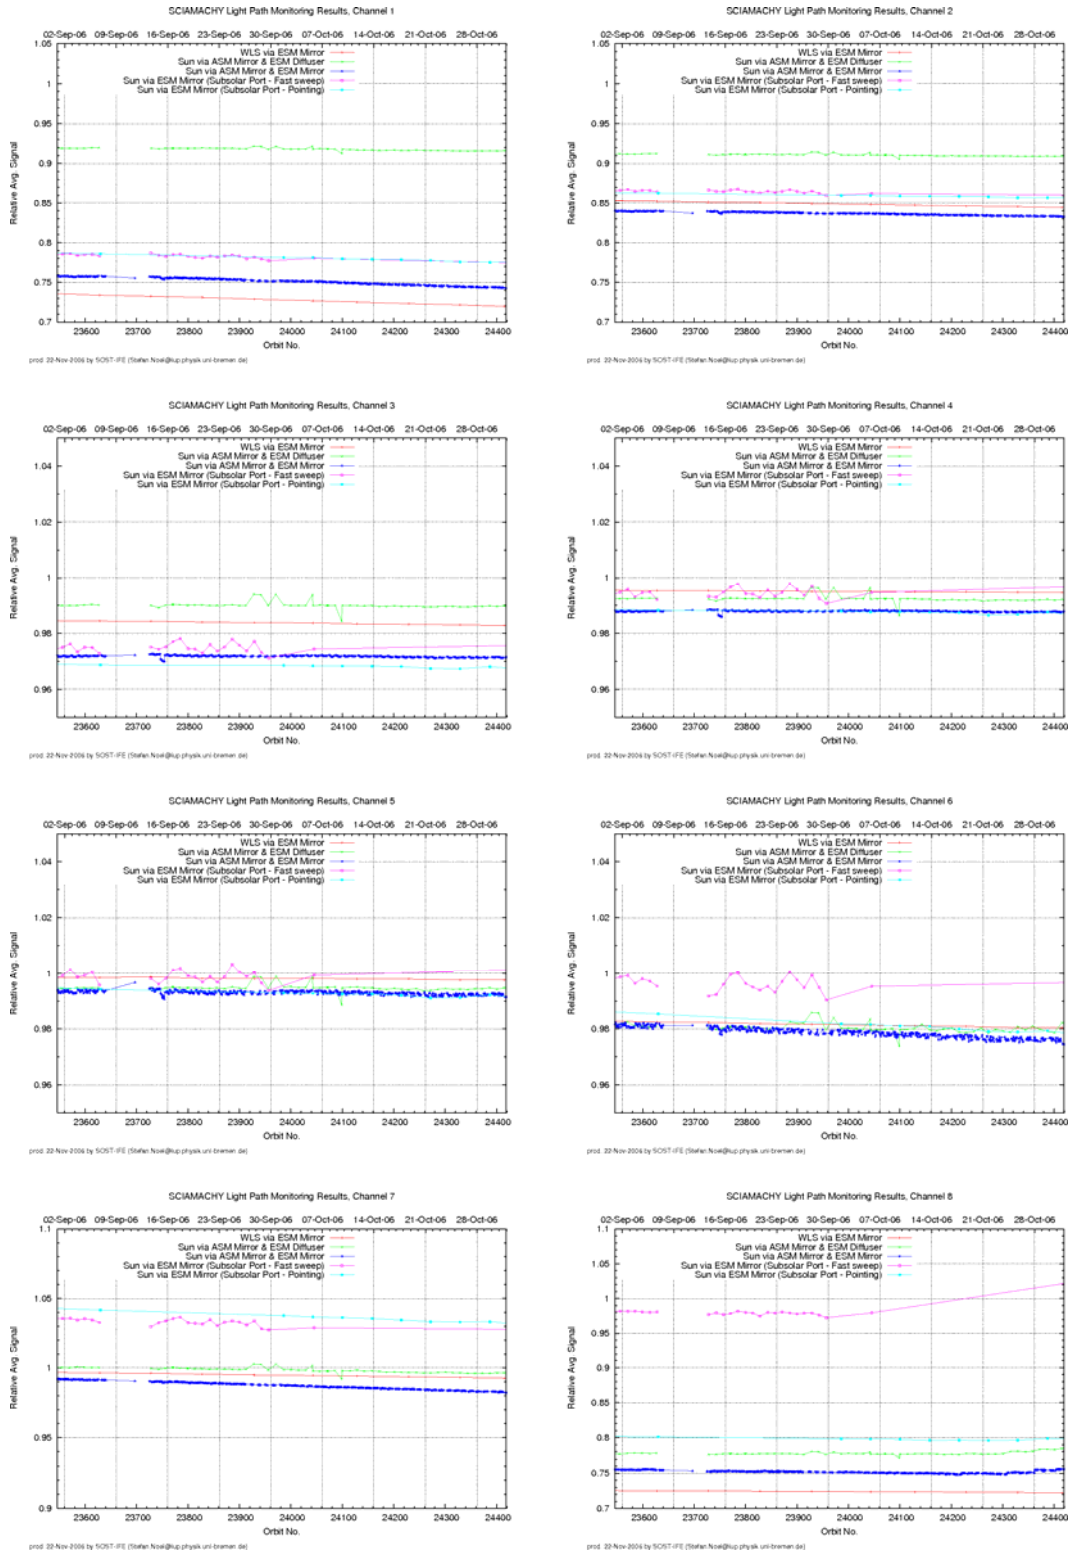

Fig. 3.7: Light path monitoring results September to October 2006.

esa

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 22 of 58

Since 1 October 2006 subsolar measurements in fast sweep scan mode are only executed once per month (before that time: daily) whereas subsolar measurements in pointing mode are executed twice per week (before: once per month).

The channel average plots in Fig. 3.7 show both data sets for the subsolar light path.

Note that the reference time for the subsolar pointing data is 16 January 2003 (instead of 10 January 2003 for subsolar fast sweep).

The light path monitoring results presented in this section may be regarded as a first step towards spectrally resolved monitoring factors (m-factors) which will be produced based on fully calibrated data.

Daily updated light path monitoring results can be found on the SOST or IUP web site (<http://www.iup.uni-bremen.de/sciamachy/LTM/LTM.html>).

The following specific features can be identified from the light path monitoring results during the time interval of this report:

- Overall, the instrument throughput changes were as expected.
- For all light paths involving the ESM mirror the degradation in the UV (channels 1 and 2) increases with a rate of about 0.5-1% per month, as observed during the previous time intervals. The average throughput loss in channel 1 lies currently around 26%. The throughput of the calibration light path which involves the ESM diffuser instead of the ESM mirror is currently at about 92% and decreased over the two months covered by this report by about 0.5%.
- The overall degradation of channel 3 is very small (about 2%) compared to channels 1 and 2, but is still slowly increasing.
- Channel 4 and 5 remain stable on a sub-percent level, although especially channel 5 seems to show a slight throughput decrease over the two months of this report.
- The channel 6 throughput is still at high level (about 98%) and decreases by less than 0.5% within two months.
- Channels 7 shows a small throughput decrease of about 0.5%/month.
- Channel 8 transmission remains quite stable at about 75% (depending on light path). Note that the subsolar pointing results are more reliable here (and more in line with the other light paths) than the fast sweep data.

There is one feature visible in the plots which has not been noticed before: The ESM diffuser (calibration) light path shows several small peaks (especially visible at 12 September and 5 and 9 October 2006). These peaks occur at times where the same measurement state was part of two (NRT) level 0 data files (usually the first and the last state in the file), but where the monitoring gives slightly different results. In fact, this happened before but the differences were usually so small that they could not be identified. Since the software used to analyse these data is the same in all cases it is assumed that the reason for these discrepancies lies within the Level 0 NRT products. However, no (formal) error in the corresponding products could be detected, therefore the “correct” value can not be identified. It is also unclear if and how other states or data products may be affected.

### 3.1.5.2 Spectral light path monitoring results

Fig. 3.8 – 3.11 show results of spectral throughput monitoring performed by SOST-IFE for the different light paths (nadir, limb, calibration, and WLS). These results have been derived from Level 0 data analysed in a similar way as for the channel averaged throughput data (but of course without spectral averaging). Because the variation in spectral direction is very small within two month, Fig. 3.8 – 3.11 show the complete time series from 2 August 2002 to the end of October 2006.

#### Notes:

- Dates in the graphs refer to UTC noon (12:00).
- The data have been interpolated over dead/bad pixels (using the on-ground list).
- Data from times of reduced instrument performance (like decontaminations or instrument switch-offs) have not been considered. These times are masked out by grey vertical bars.
- All data have been transformed to a daily grid, involving averaging and interpolation.
- Ratios have been performed on a pixel axis without any spectral interpolations. The wavelength axis is just for illustration and gives only approximate values, assuming a linear relation between pixel number and wavelength.
- Depending on the availability of measurement data, features close to large data gaps (especially before and after a decontamination) may be caused by interpolation.
- WLS data have not been corrected for a potential degradation of the lamp. Only the intensity jump after the extended WLS usage in June 2003 has been removed.
- As mentioned before, the timing of subsolar measurements before 30 November 2002 did not consider the known yaw misalignment of SCIAMACHY on ENVISAT. The timing has been corrected in the final flight settings. To take this change into account, all subsolar measurements have been referred to orbit 4519 (10 January 2003).  
Therefore, subsolar results before 30 November 2002 are not reliable.
- Subsolar pointing data are not considered here yet because of their low measurement frequency before October 2006. Activities to generate a joined consistent subsolar fast sweep/pointing data set are ongoing.

The underlying data for the spectral monitoring are available via the SOST-IFE web site (see [http://www.iup.uni-bremen.de/sciamachy/LTM/LTM\\_spectral/LTM\\_spectral.html](http://www.iup.uni-bremen.de/sciamachy/LTM/LTM_spectral/LTM_spectral.html)). As for the plotted results, these data are regularly updated one to two times per month.

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 28 of 58

The following main features can be identified in the spectral monitoring plots:

- As expected, the UV degradation generally decreases with increasing wavelength.
- The SCIAMACHY degradation strongly depends on wavelength and is largest at the channel edges. The prominent degradation peak around 350 nm in channel 2 coincides with a region of high polarisation sensitivity, although this is probably not directly related.
- The minimum throughput reaches about 60% for the limb and WLS (nadir) light paths at the short wavelength edge of channel 1.
- Also solar activity variation can be seen in the plots, e.g. the intensity change of the solar Mg II Fraunhofer line at about 280 nm.
- The degradation in channel 3 which was already indicated by the channel integrated results is much better visible in the spectrally resolved plots, where the propagation of this effect in time to higher wavelengths can be clearly identified.
- The difference in degradation between the diffuser light path and the other light paths is also visible in the plots; however, the spectral regions where degradation is strongest coincide quite well.
- The spectral plots also show that the relative stability for channels 4 and 5 observed in the integrated data is not present over the whole spectral range; also these channels show variations, but these are restricted to the overlap regions close to the channel edges.
- Channel 6 spectral results confirm the assumption of a slight degradation in this channel which is concentrated at the lower wavelength edge and independent of the overlaid remaining seasonal cycle.
- For channels 7 and 8 the spectral behaviour of the throughput loss is consistent with (broadband) ice absorption features. The effect of the decontaminations is of course also clearly visible in these channels.
- Especially channel 8 shows a large pixel dependence of the throughput variation caused by the different sensitivity of the pixels. This variation is much higher for light paths where the small aperture is involved (i.e. nadir (subsolar) and limb), indicating that the small aperture causes additional effects which need to be considered when applying these results to Earthshine data.
- In general, the WLS data are much smoother than the solar data.

### 3.1.5.3 PMD monitoring results

The SCIAMACHY PMDs are monitored in a similar way as the science channels, but of course no channel averaging is performed. However, the results presented here are based on the same measurements as the science channel results (but using the PMD low gain signal), and they have been normalized to the same reference times.

For the nadir light path it is not possible to use subsolar fast sweep measurements for PMD monitoring, because these show too large scatter. This is probably caused by a combination of the very time-sensitive measurement type and scan mode and the fact that the PMDs measure a sampled signal, not an integrated one. Therefore, subsolar pointing measurements are used for monitoring of the PMD nadir light path, because the pointing signal is much more stable. Until October 2006 subsolar pointing measurements were

esa

DLR

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 29 of 58

only performed once per month, therefore the temporal sampling is much less than for the other light paths. Since 1 October 2006 the number of subsolar pointing measurements has been increased (on the cost of subsolar fast sweep data).

This reduced temporal sampling is also the reason that Fig. 3.12 shows the PMD throughput variation for the whole time period between 2 August 2002 and 31 October 2006 (instead of only the two month time interval of this report). Note that a constant dark signal for each of the PMDs has been assumed. To verify this assumption, Fig. 3.12 also shows the variation of the PMD dark signal over time, which is usually quite low.

Note that PMD 7 results are most likely dominated by straylight and not reliable. They are only shown for completeness. Furthermore, WLS data are only available for PMD 1 to 3 because of saturation in the other PMD channels.

Considering the broadband character of the PMDs, the observed PMD throughput changes are (except for PMD 4 and 7) very similar to those of the science channels with the following features:

- The UV degradation apparent in the science channels is also visible in PMD 1 to 3.
- PMD 4 and 7 (which cover the same wavelength interval) show a considerably large decrease in throughput which is still unexplained (but may be related to the specific detector material).
- There are remaining seasonal variations in the data which could up to now not be corrected out. The amplitude of these seasonal variations increases with the wavelength range covered by the PMD. This issue is still unresolved.
- The PMD 6 dark signal shows a strange variation over time which is still under investigation.

A more detailed investigation of the open issues listed above requires a better calibration of the monitoring data which is currently (in the context of m-factor generation) under development, but will probably take some time.

These occurrences of data corruptions are currently under investigation.

### 4.2 Statistics on unconsolidated data (SCI\_NL\_\_0P, SCI\_NL\_\_1P)

This paragraph reports the availability of NRT data on a monthly basis. The statistics are based on level 0 data and level 1 data inventoried in the ground segment. Unavailability periods due to instrument anomalies or Satellite switch-offs are excluded. The gaps considered are only interfile gaps. During September and the first day of October the Antenna Pointing Controller anomaly caused a significant data loss for products received via Artemis (see also 3.1.3. Anomalies). In September 27 orbits were lost and in October 3 orbits, which impacts the statistics accordingly.

Fig. 4-1: Statistics on available unconsolidated level 0 and level 1 products

### 4.3 Statistics on consolidated data

Statistics on consolidated data products level 0 and level 1 are currently not available. They will be included again into the next reports.

#### 4.3.1 Anomalies on level 0 consolidated data products

In the past it had been reported by SOST-DLR that the SCIAMACHY consolidated level 0 data contain errors and are not complete. Following specific problems have been identified and are reported in detail in the technical notes [3], [4] for years 2003 and 2004 as well as for products of 2005 [5]:

- For one orbit there can be more than one consolidated level 0 product. These products may be identical or different in content (disregarding the product type file counter).
- Some orbits are not covered by consolidated level 0 products although SCIAMACHY was operational.
- Some orbits are covered by consolidated level 0 products but the product duration does not comply with the actually planned and executed instrument operations in that particular orbit.
- Some consolidated level 0 products exceed the Reed Solomon correction threshold and are flagged accordingly. The occurrence of Reed Solomon errors is non-uniform.
- Until late October / early November 2003 consolidated level 0 data are hampered by an incorrect orbit number.

esa

DLR

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 34 of 58

More details on consolidated level 0 anomalies can be found on the SOST web page, which contains a catalogue of available level 0 consolidated data and description of errors.

[http://atmos.caf.dlr.de/projects/scops/data\\_availability/availability.html](http://atmos.caf.dlr.de/projects/scops/data_availability/availability.html)

The errors contained in the consolidated level 0 data have been formally transferred into Observation Anomaly Reports (OAR) towards the ENVISAT ground segment.

As a consequence in the beginning of December 2005 a dedicated meeting was held at ESA to implement a strategy to improve the product quality of consolidated level 0 data and to reprocess erroneous products in the historic data set.

A recovery plan was initiated in order to reprocess erroneous data 2002 - 2004. This activity has been completed. Following this recovery plan also the data for 2005 were analysed and reprocessing of anomalous data has been completed as well.

Next step afterwards will be the flagging of duplicate level 0 products in the ENVISAT ground segment inventory.

The overall goal is to achieve a level 0 consolidated data 'master set' that will allow data reprocessing of improved data quality.

#### **4.4 *Statistics on reprocessed data***

The reprocessing of products from the time interval July 2002 to May 2004 (corresponding to cycles 7 -26, each cycle consisting of 501 orbits) with IPF 5.04 has been completed. See also BMR September-October 2005 for details.

A second reprocessing cycle is foreseen with IPF 6.02 or higher for level 1b processing and the level 2 off-line processor 3.00 or higher starting in the first quarter of 2007. The reprocessing will follow after the recommendation of the 3<sup>rd</sup> ACVE workshop in December 2006 have been evaluated and possibly implemented into the processors.

## 5 LEVEL 1 PRODUCT QUALITY MONITORING

### 5.1 Processor Configuration

#### 5.1.1 Version

The current IPF version used for processing of SCIAMACHY level 1 data is 6.02. For an interim period, between 22 May 2006 and 07 June 2006, IPF 6.01 was activated. The recommendation is to not use level 1b products generated with IPF 6.01. Instead the Off-line data IPF 6.02 for the period 22 May 2006 to 07 June 2006 should be used for scientific analysis.

The corresponding product specification has been updated. The actual version now is Volume 15 issue 3/k [2] available at

[http://earth.esa.int/pub/ESA\\_DOC/ENVISAT/Vol15\\_Sciamachy\\_3k.pdf](http://earth.esa.int/pub/ESA_DOC/ENVISAT/Vol15_Sciamachy_3k.pdf)

The disclaimer at

[http://envisat.esa.int/dataproducts/availability/disclaimers/SCI\\_NL\\_1P\\_Disclaimers.pdf](http://envisat.esa.int/dataproducts/availability/disclaimers/SCI_NL_1P_Disclaimers.pdf) describes known artefacts as well as major improvements with respect to the previous IPF version.

During the period 13 to 18 May 2006 a number of level 1b IPF 6.02 off-line products were processed with outdated auxiliary files. These occurrences are described in more detail in the disclaimer mentioned above. Appendix B lists the product names of the level 1b data affected. These products were removed from the D-PAC ftp server and should not be used. The corresponding orbits were already reprocessed with the correct auxiliary files.

An IPF implementation error was detected which results in erroneous Leakage GADS in the off-line processing chain. In some cases level 1b products contain leakage values equal to 0 in channel 6-8 or the values are anomalously high. A patch of the IPF to version 6.03 is in preparation.

Table 5.1 gives a brief overview of changes implemented with processor versions IPF 6.02, 6.01, 5.04 and 5.01.

Following definition of the SZA for Limb/Occultation measurements are used in previous and actual IPFs:

- For IPF versions 4.02, 5.00, 5.01, 5.04, 6.01, 6.02 the SZA is defined with respect to Top of Atmosphere (TOA).
- For IPF versions 4.03, 4.01 and earlier versions the SZA is defined with respect to Tangent Height.

IPF versions 4.02 and 5.00 however were not used operationally but to generate the validation dataset for the ACVT workshop in 2004.

Tab. 5-1: Processor Version and main changes

### 5.1.2 Auxiliary Data Files

For operation of the SCIAMACHY level 1 processor a set of auxiliary files as input is required.

One subset of these auxiliary files usually changes only in correspondence with a new IPF version, namely the Initialisation file (SCI\_LI1\_AX), the Key Data File (SCI\_KD1\_AX).

In addition there is the m-factor file (SCI\_MF1\_AX), which shall describe the degradation of the instrument during its stay in orbit. Note that the m-factor file has not been changed so far.

Another subset of auxiliary files are the In-flight calibration data files which are generated when calibration measurements are included in the set of level 0 data to be processed. Four types of In-flight calibration auxiliary files exist:

- Leakage Current Calibration (SCI\_LK1\_AX - updated on orbital basis)
- Solar Reference Spectrum (SCI\_SU1\_AX - updated on daily basis)
- Spectral Calibration Parameters (SCI\_SP1\_AX - updated on a weekly basis)
- Pixel-to-Pixel Gain and Etalon Parameters (SCI\_PE1\_AX - updated on a weekly basis)

esa

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 38 of 58

With the activation of the new IPF 6.01 and IPF 6.02 the generation of in-flight auxiliary files is based on level 0 data, and a new calibration tool, SCICAL, was set in operation. SCICAL replaces the computation of ADFs that previously was performed by IECF, while IECF remains the interface for operational ADF dissemination, monitoring activities and database for the ADFs. SCICAL therefore can be considered integral part of the ENVISAT ground segment.

SCICAL provides the advantage that all auxiliary files are generated automatically, SCI\_SP1\_AX and SCI\_PE1\_AX files are now updated once per week, using the weekly calibration measurements as input.

In previous reports the complete list of the in flight auxiliary files for the reporting period was provided. From this report onwards this list will not be provided in the BMR. If needed the list of ADFs can be requested via the EOHhelp service.

Table 5-2 lists the actual Key Data File and Initialisation File used with IPF 6.02.

**Table 5-2**

SCI_LI1_AXVIEC20060523_182643_20020701_000000_20991231_235959
SCI_KD1_AXVIEC20060523_182626_20020301_000000_20991231_235959

Fig. 5.1 shows statistics of the SU1 and LK1 ADFs generated operationally with the SCICAL. It has to be noted that unavailability periods are excluded from statistics. Generation of SU1 ADFs for September and October 2006 was 100%.

The LK1 ADF statistic is calculated by dividing the number of all LK1 ADFs by number of all available (to SCICAL) level 0 products. The statistics on available LK1 ADFs during September (60.9%) and October 2006 (65.4%) are slightly lower than in the previous reporting period, which needs to be investigated further. The statistic does not exclude dark measurements that cannot be used for ADF generation due to SAA and orbit phase constraints leading to an over-estimation of missing files.

page 39 of 58

### 5.1.3 Spectral Performance

Future reports will contain analyses of spectral performance.

### 5.1.4 Radiometric Performance

Future reports will contain analyses of spectral performance.

### 5.1.5 Other Calibration Results

#### 5.1.5.1 SMR analysis

SCICAL generates daily SU1 Auxiliary Files. Solar spectra obtained from ESM and ASM calibration measurements are provided fully calibrated and not radiometrically calibrated.

The different types of spectra can be recognized by the so called identifier in the solar reference global annotation data set record.

In difference to previous versions, no solar reference spectra from occultation or sub-solar measurements are provided by the GADS, as they turned out to be of no use for trace gas retrievals.

Note the following recommendation:

- Use a not radiometrically calibrated ASM diffuser spectrum (A0) for DOAS type applications.
- All retrieval methods requiring absolute calibrated radiance and irradiance are obliged to use the calibrated ESM diffuser spectrum (D0) (see also disclaimer).

Fig. 5-2 to Fig. 5-5 show the ratios of SMR spectra derived from calibrated SMR/ESM (D0) during the months September - October 2006. The ratios were determined by dividing the spectra of the beginning of each month to a set of days during each month. All ratios are not corrected for variation of distance earth/sun.

In detail the spectra used for the ratios of each month are the following:

- **September 2006**  
Reference SMR - 01 September 2006  
SMR used for ratios: 02, 03, 04, 05, 06, 11, 14, 21, 28 September 2006
- **October 2006**  
Reference SMR - 01 October 2006  
SMR used for ratios: 02, 03, 04, 05, 09, 10, 14, 21, 28 October 2006

During September 2006 a long instrument unavailability occurred. This impacts the ratio plots accordingly. The black curve shows the ratio from 11/01 September, the 11<sup>th</sup> of September was the first SMR spectrum after the instrument availability.

The overall changes lie at about 1 % during one month for all channels, which is at least partly caused by the increasing distance between sun and earth. In channel 1 around pixel

esa

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 40 of 58

550 (at 282 nm) some strong features can be noticed, as well as in channel 2 near pixel 840 (near 393 nm). These strong features coincide with the Mg II and Ca Fraunhofer lines respectively. These lines are partially formed in the solar chromosphere and are known to change with solar variability.

The weaker spectral features in channel 2 (e.g. near pixels 550, 650,750), on the other hand, correlate with strong Fraunhofer lines, which are not chromospheric. These features probably arise from small wavelength shifts (order of 1/100 of a pixel).

Generally a spectral feature could have significant impact on the product quality, especially when the affected spectral parts are used for DOAS retrieval.

The large features in the end of channel 6 (channel 6+) and channels 7 and 8 are due to bad pixels.

Note that the bad pixel mask used is still from the on ground calibration.

A regular update of the bad pixel mask is implemented starting with IPF 6.02. However a bad pixel correction will not be applied to the SMR spectra, but only to PMD out-of-band factors, in order to enable the user to apply a different mask from the one provided by the ADF.

Fig. 5-6 and Fig. 5-7 show SMR ratios on a long term trend dividing the ESM spectra from days 30 September 2002 and 30 September 2006, respectively 31 October 2002 and 31 October 2006. The first spectrum available exists for 18-Jul-2002. However to consider sun/earth distance, the ratio was performed with spectra from same calendar days. All SCI\_SU1\_AX files used were generated with SCICAL.

What can be concluded is that for channels 1-2 an average degradation of about 7% is observed, channels 3 degrades by about 2% and channels 4-6 degrade by less than 1%. The signal in channels 7 and 8 has increased with respect to the SMR of year 2002. This is consistent with the Light Path monitoring at SOST-IFE.

## 5.1.5.2 LK1 analysis

### 5.1.5.2.1 Leakage Constant part

On an orbital basis a leakage current calibration is performed, if measurement data do not lie in the South Atlantic Anomaly region.

In Fig. 5-8 to Fig. 5-11 the leakage constant part FPN (fixed pattern noise) of the LK1 ADFs are analysed by determining the ratios of the FPN of each month with a time distance of one orbit, one day, one week, two weeks, three weeks and a month.

For channels 1-5 and the first part of channel 6, during up to three weeks nearly no changes can be noticed. Sudden jumps however between the different dark current ratios can be seen for channels 1, 2, 4 and 5 between 2 and 3 weeks. They are very small but above the noise level.

The IR channels show a lot of noise. Note that with the new processor version IPF 6.02, the time dependent part of the leakage current is considered (see 5.1.5.2.2).

### 5.1.5.2.2 Leakage Variable part

With the IPF 6.02 the orbital dependency of channel 6 to 8 leakage current is considered. SCIAMACHY detector channels 6 – 8 have a time dependent leakage dark signal that consists of two components, the leakage current of the detector pixel and second a component due to thermal background that varies along the orbit.

The implementation of the orbital variation of the leakage current is expected to improve retrieval especially in detector channel 8, e.g. for infrared products.

Figure 5-11 shows an example of the newly included leakage variable part into the SCI\_LK1\_ADF. The leakage variation for selected pixels in channels 6-8 in dependency of the orbit phase (12 values between 0 and 1) are shown.

As the orbital variation is different for each individual detector pixel, the lower picture shows a selected range of detector pixels and their orbital leakage variation, showing a typical sine curve. Differences between the detector pixels are due to the quality of the pixels. In case of dead pixels, strong outliers are expected.

Future reports will contain further details.

### 5.1.6 Pointing Performance

The new SCIAMACHY processor IPF 6.02 contains the implementation of a limb pointing correction scheme. Results on first products analysed by IFE Bremen were summarised in previous BMR.

Note, that only operational level 1b Off-line products contain the pointing correction, used for level 2 Off-line processing with version 3.0.

However the following operational problem was identified:

Due to a current shortcoming in the Restituted Attitude auxiliary file, no off-line consolidated Level 1b product for orbits crossing 00:00 UTC can be processed.

Therefore also no corresponding Level 2 Off-Line product can be provided.

Corrective actions are ongoing and the corresponding files, both Level 1b and Level 2, will be processed as soon as possible.

Investigation to improve the pointing also further is on-going. A dedicated pointing meeting is planned at IFE Bremen for 30<sup>th</sup> November 2006.

## 5.2 SciaL1c tool

The SciaL1c tool is an application provided to the users of SCIAMACHY Level 1b products. This application allows to select specific calibrations to apply to Level 1b data, which are in case of SCIAMACHY defined as not fully calibrated Level 0 channel information in combination with calculated calibration data. The generated Level 1c products are suitable for the user's particular applications. This tool had been available with EnviView for IPF version 5.04 (and previous).

SciaL1C Calibration and Extraction Software was upgraded to be compatible with IPF 6.02 data. It is downward compatible, i.e. it can also be used with data from older IPF versions. The SciaL1c tool provided with Enviview is outdated and should not be used with the new IPF 6.02 products.

The tool of the current version 1.23 can be downloaded as Linux or Sun Solaris executable from

<http://earth.esa.int/resources/softwaretools/>

An upgrade of this version is in preparation in order to improve the performance of the tool. Additional executables are foreseen to be provided in the near future as well.

## 6 LEVEL 2 NRT PRODUCT QUALITY MONITORING

### 6.1 Processor Configuration

#### 6.1.1 Version

Since 08 May 2006 the near real time processing of SCIAMACHY level 2 data has been suspended, evolution is currently restricted to the level 2 Off-line processor (see chapter 7).

The last IPF version used was 5.04. The corresponding product specification is [2]. The disclaimer at

[http://envisat.esa.int/dataproducts/availability/disclaimers/SCI\\_NL\\_2P\\_Disclaimers.pdf](http://envisat.esa.int/dataproducts/availability/disclaimers/SCI_NL_2P_Disclaimers.pdf) describes known artefacts.

Table 6.1 shows the implementation dates of the IPF at the different PDS processing centres and the main modifications implemented.

IPF Version	Description	Proc Centre	Date	Start Orbit
5.04	No algorithm specification changes were implemented, but two algorithm	PDHS-K	21-AUG-2004	12942
		LRAC	20-AUG-2004	12750

## 7 LEVEL 2 OFF-LINE PRODUCT QUALITY MONITORING

### 7.1 Processor Configuration

#### 7.1.1 Version

The current Level 2 Off-line processing version is 3.0, operational since 08 August 2006. Level 2 data with this version were processed in backlog starting with orbit 21824, 03 May 2006.

The product specification corresponding to the level 2 off-line processor 3.00 is Volume 15, issue 3/k [2] and can be found at

[http://earth.esa.int/pub/ESA\\_DOC/ENVISAT/Vol15\\_Sciamachy\\_3k.pdf](http://earth.esa.int/pub/ESA_DOC/ENVISAT/Vol15_Sciamachy_3k.pdf)

The disclaimer at

[http://envisat.esa.int/dataproducts/availability/disclaimers/SCI\\_OL\\_2P\\_Disclaimers.pdf](http://envisat.esa.int/dataproducts/availability/disclaimers/SCI_OL_2P_Disclaimers.pdf) describes known artefacts.

Not included in the disclaimer are anomalies identified during the validation by the SCIAVALIG team. These anomalies are

- OAR 2574: Cloud Aerosol quality flag – wrong contents  
MDS Cloud and Aerosol, contains the quality flag (no.3) which should contain only the value 0 or -1. Values however are varying between -120 and + 140, mismatch with cloud flag.
- OAR 2605: Cloud MDS AAI's set to 0. Operational Processing went into failsafe mode which generates values of 0 for AAIA. The problem does not occur in the validation data set (extracted states), but in the full operational products.
- OAR 2810: Inconsistency between VMR given in the product and derived from partial column and (p,T) in the product had been claimed for: The inconsistency is due to the fact that the (p,T) profiles are given on measurement grid and the VMRs are derived on retrieval grid. The conversion between both grids must include the climatology for the determination of the retrieval grid (which can not be derived from the product). Hence, the derivation of VMRs is not a priori possible without more detailed knowledge of the internals. In context of this claimed anomaly an interchange within the product entries p and T had been observed which leads to the impression of unrealistic temperature and pressure values. This bug is under fixing.
- OAR 2811: Error estimate for NO<sub>2</sub> is some factor higher than expected. Due to an implementation bug a normalization factor had been multiplied into this quantity leading to some factor higher results. Bug is under fixing.

page 53 of 58

SCI\_OL\_2P products contain geo-located vertical column amounts of O<sub>3</sub>, NO<sub>2</sub> Nadir measurements, as well as stratospheric Limb profiles of O<sub>3</sub>, NO<sub>2</sub>. Additionally the fractional cloud coverage, the cloud-top height, and the cloud optical thickness are derived and provided as product to the user. The major upgrades are summarised in table 7.1.

Processor Version	Description	Proc Centre	Date	Start Orbit
3.00	<ul style="list-style-type: none"> <li>Nadir UV/Visible algorithm for ozone and NO<sub>2</sub> is based on the GDP (GOME Data Processor) Version 4.0</li> <li>Nadir UV/Visible algorithm for cloud-top height and cloud optical thickness based on the SACURA algorithm</li> <li>Limb UV/Visible products: Stratospheric Ozone and NO<sub>2</sub> profiles</li> <li>Improved pointing performance through the use of the Envisat Restituted Attitude information in the consolidated Level 1b product</li> </ul>	D-PAC	03-MAY-2006	21824
2.5	<ul style="list-style-type: none"> <li>First operational version of processor</li> </ul>	D-PAC	January 2005	-

## 7.2 *Monitoring results*

### 7.2.1 *NADIR: NO<sub>2</sub> consistency checking*

The world map plots of NADIR NO<sub>2</sub> vertical column density (VCD) values averaged over one month are generated from the SCI\_OL\_2P NADIR products. Fig 7.1 and 7.2 show the monthly world map plots for September and October 2006.

Generally, high concentration of NO<sub>2</sub> is expected over industrial regions, as over North America, especially the East coast, over central Europe, China and South Africa. Values at high SZA are currently not filtered, which results in unphysical values in the monthly average plots.

The data gap over the Pacific and Australia results from the missing AUX\_FRA coverage crossing midnight. Orbits covering this period will be processed in off-line mode at a later state.

## 8 VALIDATION ACTIVITIES AND RESULTS

### 8.1 Validation Approach

The new level 1b processor IPF 6.02 and level 2 off-line processor version 3.00 are assessed with respect to the quality of the data products.

The scientific validation is performed by a wide group of scientists SCIAVALIG, representing the specialists for the different data products.

Detailed information about SCIAVALIG activities and results can be found at:

<http://www.sciamachy.org/validation/>

The Validation of the new SCIAMACHY products shall result in

- Error estimates
- Recommendations for algorithm improvement
- Recommendations on reprocessing activity

First results were discussed in the preliminary validation meeting at KNMI on 20 September 2006. A complete analysis on the results is expected at the ACVE-3 in the beginning of December 2006 in ESRIN.

### 8.2 Validation Data set

A set of SCIAMACHY measurement states was defined by SCIAVALIG to be processed to level 1b and level 2 off-line products. These measurement states correspond to validation campaigns from ground based measurements, balloon measurements, aircraft or satellite inter-comparison measurements.

Table 8.1 summarises the data set requested.

Table 8-1

Year	States requested	Number of orbits
2002	742	316
2003	1349	760
2004	1608	1095
2005	186	175
Total	3885	2346

Level 1b data IPF 6.02 (by 07 July 2006) and level 2 off-line data 3.00 (by 01 August 2006) were uploaded to the following ftp server at D-PAC:

esa

serco

SCIAMACHY Bi-MONTHLY

issue 1 revision 1 -

page 57 of 58

ftp://ftp-ops.de.envisat.esa.int

### 8.2.1 Extended Validation Data Set

As a result from the preliminary validation meeting in September 2006 an additional validation data set was requested containing full orbits of full days as well as some individual states. The following data were made available by end of October 2006:

Full days	Orbits requested	Number of orbits not available
20041111	56	2 Orbits corrupt level 0
20050210		2 orbits crossing midnight
20050515		
20050814		
20040325	30	4 orbits crossing midnight
20040916		
Individual states	Number of states requested	Number of states not available
Between 20040410 & 20051009	33	5
