

Weekly Results from 26th May until 2nd June 2002

Figure 1 shows the evolution of the mean yaw (over one orbit) and its standard deviation for the period covered in this report. The Scatterometer data gaps are related with the orbits dumped at Maspalomas and Gatineau station. Those data are send to PCS with a delay of 1 or 2 weeks and are not included in this weekly report.

Due to an acquisition problem in Gatineau, data from that station are not available since 31st May 2002, orbit 37188. This fact explains the presence of regular data gaps during the last three days of the week. Others gaps are present at the beginning of the report period and are due to AMI unavailability.

Apart from data missing, the yaw evolution during the report period was within +/- 1.5 degrees. That value is better than the one computed in the previous reports (+/- 2 degrees).

As usual good agreement between wave and Scatterometer results.
