

Weekly Results from 1st September to 9th September 2002

Figure 1 shows the evolution of the mean yaw (over one orbit) and its standard deviation for the period covered in this report.

The mean yaw evolution was stable within [-2.0, +2.0] degrees until orbit 38594 (Saturday 7 September 2002) to orbit (Sunday 8 September 2002). One can note a positive bias on Saturday and a negative bias on Sunday. These large variations are certainly due to changes on solar activity.

As usual, good agreement between wave and Scatterometer results.
