

# Weekly Results from 08<sup>th</sup> September to 16<sup>th</sup> September 2002

Figure 1 shows the evolution of the mean yaw (over one orbit) and its standard deviation for the period covered in this report.

One can note a negative bias on the beginning of the week due to a high solar activity. Excluding the period of AML instrument unavailability, from orbit 38654 to 38657 on 11<sup>th</sup> September, the mean yaw was stable within [-2.0, +2.0] degrees.

As usual, good agreement between wave and Scatterometer results.
